EXECUTIVE SUMMARY

South Downs National Park Authority (SDNPA) are currently preparing Shoreham Cement Works Area Action Plan (AAP). The AAP will sit alongside the recently adopted South Downs Local Plan (SDLP) which covers the plan period 2014-2033.

Shoreham Cement Works (SCW) is allocated under Policy SD56 of the SDLP for an exemplar sustainable mixed-use development, which delivers a substantially enhanced landscape and uses that are compatible with the purposes of National Park. ADL Traffic and Highways Engineering Ltd has been commissioned by SDNPA to prepare a Transport Assessment to inform the AAP.

Shoreham Cement Works is located within the South Downs National Park which has the highest level of landscape protection in the country. This has been taken into account in the preparation of this study, particularly in terms of the site access options.

Four development scenarios have been tested to determine whether any of the scenarios in this AAP can be accommodated without any adverse traffic impact in terms of traffic capacity, sustainable travel options, road safety, key junctions, or accident hot spots.

For the baseline traffic situation, through discussion with National Highways (NH) and West Sussex County Council (WSCC), it was agreed that it would not be acceptable to use data from the Worthing and Shoreham Harbour strategic models because neither model is up-to-date and therefore not considered to be sufficiently robust for SCW. The use of traffic surveys undertaken in 2021 was also deemed to be an unacceptable approach due to unknowns regarding traffic levels in the post-Covid period. A bespoke approach was therefore taken, where WSCC provided observed traffic data from the National Highways A27 data collection programme in 2015 and from the Shoreham Free Wharf Transport Assessment in 2017.

There are a number of land use schemes already consented within the wider study area, including New Monks Farm and Shoreham Airport, as well as a number of Local Plan allocation sites within Horsham and Adur & Worthing Councils which have been considered within this study to formulate baseline traffic conditions for the year 2033.

A number of site access options have been tested, ranging from retention of existing junction improvements, priority junctions with right-turn lanes option, priority junctions with right-turn lanes and right-out movements banned option, two three-armed roundabouts option and a single four-armed roundabout option. Through rigorous modelling and consultation with SDNP and WSCC, the four-armed roundabout option was considered to be the most optimum from transport perspective. The access solutions have been developed with Roads in the South Downs 2015 guidance in mind.

A vehicular trip generation exercise with no restraint to car trips has been undertaken which establishes the worst-case weekday AM and PM peak hour trips for all four proposed development scenarios. This exercise demonstrated that the development scenarios would generate between approximately 350 and 570 vehicular movements per hour during peak hours. The four scenarios are summarised as follow:

- Scenario 1 – Mixed use, residential focus – generates 570 (AM) and 542 (PM) two-way peak hour vehicle trips, primarily private car;
- Scenario 2 – Mixed use, smaller residential focus – generates 488 (AM) and 465 (PM) peak hour two-way vehicle trips, primarily private car;
- Scenario 3 – Leisure focused – generates 325 (AM) and 417 (PM) two-way peak hour vehicle trips, with increased proportion of bus/coach movements (190 leisure related car + 3 coach trips daily); and
- Scenario 4 – Appeal scenario – generates 385 (AM) and 350 (PM) two-way peak hour vehicle trips, significant reduction in all factors.

Discussions with SDNPA and WSCC took place regarding potential reduction in car trips by taking into account sustainable transport initiatives. ADL researched Local Plan transport studies within West Sussex to ascertain a robust approach to apply reduction to car trips.

Reduction in car trips within Local Plan transport studies in West Sussex was partly based on reduction factors prescribed with DfT's Sustainable Travel Towns 2010 document *The Effects of Smarter Choices Programmes in Sustainable Travel Towns: Research Report (*2010). However, the later study *Sustainable Travel Towns: An Evaluation of The Longer-Term Impacts* (2016) demonstrated that the overall reduction in traffic was far less than previously envisaged. The reasons being that promotion activities were reduced or discontinued after initial project funding ceased or increase in public transport fares. The study therefore shows that a consistent reduction in car trips without continuous funding towards sustainable transport measures is unlikely.

Due to these reasons, it was decided that the reduction in car trips cannot be used as a first step to assess the traffic impact as this approach could result in underestimating the actual traffic impact leading to a significant funding gap for improvements in the future.

ADL has therefore formulated an approach whereby a package of sustainable measures (such as improvements to the bus services that travel along the A283 past the site, improvements to cycling and walking infrastructure such as enhanced linkages and crossings to increase the use of Downs Link cycle path) could be delivered in lieu of the physical improvements to mitigate severe traffic impact at certain junctions. The construction costs to mitigate the severe traffic impact have therefore been based on worst-case scenario (i.e., no restraint to car trips) and the costs towards some junctions are then diverted towards sustainable initiatives in the areas where these junctions are located.

Other sustainable measures, including the provision of adequate cycle parking, Car Clubs and Travel Planning, have also been proposed within this transport study.

It is acknowledged that a large number of trips associated with the development proposals would be concentrated in areas such as Shoreham-by-Sea followed by Worthing and hence there is an opportunity to maximise sustainable mode share to the trips to these areas. It was therefore considered appropriate that the proposed sustainable initiatives (and funding for these initiatives) to be mainly targeted to those travelling in these areas. As discussed above, costs to implement physical improvements to the junctions within Shoreham-by-Sea in order to mitigate severe traffic impact of the development proposals would be redirected towards sustainable travel initiatives instead.

With regard to the National Highways' (NH) junctions on the A27 (i.e., A27/A283 roundabout and A27/Grinstead Lane roundabout) and given the strategic nature of these junctions, severe traffic impact caused by the SCW development proposals on these junctions have been mitigated by way of physical junction improvements. Costs to implement these improvements have been calculated.

At the time of publishing this report, ADL are awaiting comments from NH regarding the proposed highways improvements' compliance with DMRB CD 116 (Geometric Design of Roundabouts), at the A283/A27 slips roundabout and Lancing Manor Roundabout. These compliance checks were requested by NH, but in the interest of progressing with the AAP, SDNPA have requested to proceed without their comments.

Whilst it is acknowledged that the development proposals would also impact junctions to the north of the site i.e., within Steyning and Pulborough, the sustainable travel initiatives in these locations are unlikely to reduce development car trips in these areas, given that these junctions provide connection to a wide range of destinations further afield and hence improvement to sustainable travel initiatives in these locations such as increase in bus services would not result in a material benefit. Hence, physical junction improvements within these areas have been considered as more appropriate method to mitigate traffic impact of the development proposals.

Overall, the conclusion of this study is that delivery of the proposed development scenarios is feasible from a transport perspective, but this will require highway improvement measures at the junctions located to the north of the site and on the A27 coupled with funding towards sustainable transport measures with a view to reducing private car trips.

1.0 INTRODUCTION

1.1 Background

1.1.1 South Downs National Park Authority (SDNPA) are in the process of preparing Shoreham Cement Works Area Action Plan (AAP), which will sit alongside the recently adopted South Downs Local Plan (SDLP), which covers the plan period 2014-2033.

1.1.2 ADL Traffic and Highways Engineering Ltd have been instructed by SDNPA to prepare this Transport Assessment (TA) to assess the transport impacts of four development scenarios in connection with Shoreham Cement Works, thus informing the preparation of the AAP.

1.1.3 ADL undertook extensive discussions with stakeholders, including SDNPA, West Sussex County Council (WSCC) and National Highways (NH), throughout the process to ensure that a number of transport planning elements such as trip generation, trip distribution, traffic growth factoring and traffic impact analysis were agreed as early as possible.

1.1.4 This TA has been prepared in accordance with the Planning Practice Guidance, National Planning Policy Framework (2021) and South Downs Local Plan (July 2019).

1.2 Supporting Documents

1.2.1 ADL have prepared four Technical Notes which supplement this final Transport Assessment. These outline and assess the various elements required to carry out this transport study, they are as follows:

- Technical Note 1: Permitted and Proposed Trip Generation and Distribution
- Technical Note 2: Committed Development
- Technical Note 3: Junction Capacity Assessment
- Technical Note 4: A27 Merge/Diverge Assessment

1.2.2 Each of the Technical Notes have been reviewed by stakeholders in order to reach an agreement to guide this transport study. Details of this are elaborated on in Section 2.0 of this report.

1.3 Scope of Study

1.3.1 Section 2.0 summarises the discussion that have taken place between ADL and the stakeholders (SDNPA, WSCC and NH).

1.3.2 Section 3.0 describes the site and surrounding area, including the highway network in the vicinity of the site and broader context.

1.3.3 Section 4.0 analyses the official accident data for the latest 5-year period, provided by WSCC for the study area.

1.3.4 Section 5.0 summarises the permitted trip generation of the site.

1.3.5 Section 6.0 summarises the baseline traffic scenario in Year 2033 and committed development traffic.

1.3.6 Section 7.0 describes the accessibility of the site to non-car modes of transport, including walking, cycling and public transport.

1.3.7 Section 8.0 outlines the four development scenarios tested in this transport study.

1.3.8 Section 9.0 outlines the proposed trip generation of each of the site uses for each development scenario.

1.3.9 Section 10.0 outlines the trip distribution methodology for the proposed trip generation.

1.3.10 Section 11.0 describes the sustainable transport measures which would act as mitigation for the proposed development.

1.3.11 Section 12.0 describes the proposed access arrangements for the site.

1.3.12 Section 13.0 undertakes a junction capacity assessment of each of the junctions in this study, for each development scenario, compared to the 2033 baseline scenario (i.e., no development).

1.3.13 Section 14.0 details the budget cost estimates for the proposed off-site highways works.

1.3.14 Section 15.0 summarises and concludes this transport study.

2.0 DISCUSSIONS WITH SHAREHOLDERS

2.1 Inception Meeting

2.1.1 An Inception Meeting took place on 14th July 2021, this included ADL as well as officers from SDNPA, WSCC and NH.

2.1.2 Various aspects of the transport assessment were discussed, such as:

- The site's context in terms of policy, permitted use, constraints and local highway network;
- Proposed methodology for data collection;
- Proposed methodology for trip distribution;
- Forecasting;
- Capacity assessments of specific junctions to be affected;
- Road safety, including collision data acquisition and assessment;
- Air quality,
- Mitigation strategy of affected junctions and proposed site accesses; and
- Design and costing principles.

2.1.3 The notes of meeting are provided as Appendix 1.1.

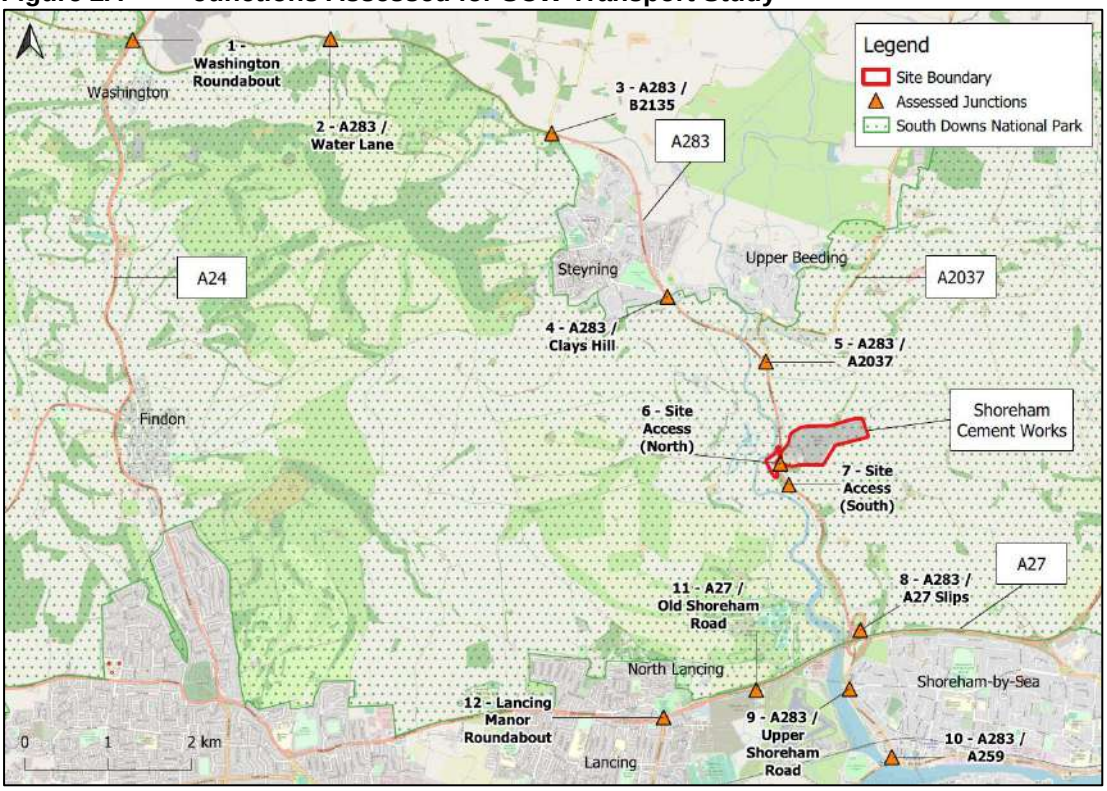
2.1.4 As per discussions with WSCC and NH, it has been agreed that the following junctions are to be assessed for each of the development scenarios:

1) A283 / A24 (Washington) Roundabout;
2) A283 / Water Lane / Chanctonbury Ring Road Crossroads;
3) A283 / Horsham Road (B2135) Staggered Junction;
4) A283 / Maudlin Lane / Clays Hill / Castle Lane / The Street Roundabout;
5) A283 / A2037 Roundabout;
6) Site Access (North);
7) Site Access (South);
8) A283 / A27 Slips Roundabout;
9) A283 / Upper Shoreham Road Roundabout;
10) A283 / A259 Roundabout;
11) A27 / New Monks Farm Committed Signalised Roundabout; and

12) A27 / A2025 / Manor Road (Lancing Manor) Roundabout.

2.1.5 A plan of these junctions, and the scope of the transport study, is shown in Figure 2A.

Figure 2A Junctions Assessed for SCW Transport Study



2.2 Technical Note 1

2.2.1 ADL prepared Technical Note 1 (TN1) on 19th August 2021, which provided the following elements:

- Vehicular trip generation associated with existing uses on site;
- Vehicular trip generation associated with development scenarios; and,
- Trip distribution and assignment methodology.

2.2.2 Prior to preparation of TN1, ADL met with SDNPA and WSCC officers on 5th August 2021. Notes of this meeting are provided in Appendix 1.2.

2.2.3 A copy of TN1 is provided as Appendix 1.3.

2.2.4 The copy of TN1 was then submitted to NH on 19th August 2021. Two sets of comments were obtained from NH on TN1 via emails, on 8th September 2021. Copy of the email is provided in Appendix 1.4. Comments from NH have been taken into account within this TA, salient points raised are as follows:

- NH accepted that permitted trips will be subtracted from the proposed use to obtain 'net' increase in trip generation.
- NH requested TRICS data for E(d) Leisure use.
- NH accepted total trip generation (taking into account school internalised trips) will be considered within our Transport Study Report.
- NH did not accept ADL's methodology with regard to internalised employment trips.
- NH requested for the acronyms HBW, HBO and NHB to be defined and explained within the Transport Study report.
- NH accepted that a CMP would be prepared as part of any future planning application subject to the decision made by the LPA.

2.2.5 The leisure use trips are discussed in more detail in Section 2.4. The school use discussed in TN1 is no longer proposed as part of SCW. Initial work as part of TN1 included an assumption that development scenarios 1, 2 and 3 included a large school facility with a total area of 10,000 sqm. This assumption resulted in significant development trips for these scenarios which in turn caused majority of the junctions along the A283 and A27 within study area to experience severe traffic impact.

2.2.6 Employment trips have not been internalised, and hence the residential and employment trips reflect a worst-case scenario.

2.2.7 The different forms of Mobile Network Data are defined and described in Section 10.1.

2.3 Technical Note 2

2.3.1 ADL prepared Technical Note 2 (TN2) which provided the following elements:

- Committed developments in Adur & Worthing Councils;
- Committed developments in SDNPA; and
- New Monks Farm and Shoreham Airport Development.

2.3.2 TN2 was a product of a continued positive discussion with WSCC officers. A copy of TN2 is provided as Appendix 1.5.

2.3.3 NH provided their comments on 30th September 2021, whereby ADL's adjusted TEMPRO growth factors were agreed, as well as assumptions regarding traffic growth in SDNPA. Copy of these emails are provided as Appendix 1.6.

New Monks Farm

2.3.4 With regards to New Monks Farm, NH suggested that the non-residential element of New Monks Farm, other than IKEA should be tested and that discussions with local authority to be carried out to obtain further details regarding the maximum quantum of employment use.

2.3.5 In response to that, ADL met with Adur & Worthing Councils Planning Officer on 4th October 2021 to discuss what assumptions are to be tested. ADL were directed towards Adur & Worthing Councils Second Addendum Revised Reissue September 2016 version of the Adur Local Plan modelling work. As stated within this document, the following breakdown was assumed for employment uses which comprised of 10,000sqm floorspace:

- Jobs
  - B1 – 333 jobs
  - B2 – 143 jobs
  - B8 – 0 jobs

2.3.6 Adur's Second Addendum Report provided trip rates for residential element of New Monks Farm and total trip generation (i.e., residential + employment) for the entire site. Using this information, employment trips were separated out.

2.3.7 The employment trips in the AM peak hour are significantly higher than IKEA trips, whilst during the PM peak hour, IKEA generated the most trips. Hence, for a robust assessment, employment trips during AM peak hour and IKEA trips during PM peak hour were used for New Monks Farm's non-residential element.

2.3.8 This strategy was emailed to SDNPA, WSCC and NH officers on 6th October 2021. In their response of 27th October 2021, NH confirmed that they found this methodology acceptable.

2.4 Further Correspondence with National Highways

Proposed Leisure Use (Use Class (E(d))

2.4.1 With regard to the proposed leisure trip generation use in Scenario 3, ADL derived annual visitor trips from four Zip World sites in Wales.

2.4.2 There are four Zip World sites in Wales (Fforest in Betws-y-Coed, Penrhyn Quarry in Bethesda, Slate Caverns in Blaenau Ffestiniog and Tower in Aberdare). In 2019, the number of visitors to all four Zip World sites was 400,000 per year; given each site has differing number of adventure activities, it is assumed that the site with most adventures (Fforest with six) could attract 150,00 visitors per year.

2.4.3 For the purpose of trip generation, ADL have made the following assumptions:

- Average car occupancy = 3 visitors per car
- Average coach occupancy = 50 visitors per coach
- 80% visitors arrive by car and 20% visitors arrive by coach
- For robust assessment, 30-week activity period (Zip World is open for longer than this).

2.4.4 NH requested supporting evidence in relation to how the above assumptions were made, in their email on 27th October 2021. Unless detailed traffic surveys at Zip World are undertaken, it is not possible to determine the exact mode split. Whilst the COVID restrictions are lifted, ADL are of the view that certain sites may continue to operate at less capacity than pre-COVID times and hence it would not be appropriate to undertake traffic surveys in 2021.

2.4.5 Furthermore, the submission of transport study timescales would not provide sufficient time to undertake the survey and analysis. Therefore, it is recommended that any future planning application(s) associated with the Use Class E(d) would need to be accompanied by a detailed traffic survey at a comparable site.

2.4.6 However, for the purpose of the SCW Transport Study, ADL can draw upon a development proposal in Ashford (Kent) for a tourist attraction based on a model railway, which ADL assisted on in 2016/17. Whilst it is appreciated that this facility is different in nature to what is being proposed on SCW, it provides some proxy for mode split given that it is a destination that would attract tourist. For this site, Kent County Council suggested that mode split based on 60% cars, 40% coach/train should be used as sensitivity test.

2.4.7 Using the Ashford site to come up with assumptions for mode split, and on the basis that the site is remote from any major public transport facility, our assumption based on 80% arriving by car and 20% by coach is considered to be robust.

2.4.8 With regard to occupancies, given the leisure use of the site, it would not be unreasonable to assume an occupancy of three people per car. Coach capacities vary from 38 to 79 depending on various size of the coaches. Hence, coach occupancy of 50 people per coach is considered to be a reasonable assumption.

Based on the above assumptions, the following is calculated:

- 120,000 visitors in cars OR 40,000 cars per year OR 1,333 cars per week 190 cars per day;
- 30,000 visitors in coaches per year OR 600 coaches per year OR 20 coaches per week OR three coaches per day.

2.4.9 A copy of email correspondence with NH regarding leisure use trips is provided as Appendix 1.7.

2.4.10 In order to gauge the arrival and departure profile for a weekday, ADL and WSCC agreed to use profile from leisure centre sites in TRICS. It was agreed that the leisure centre use profile was more representative than that of leisure park use, as the pattern of use in terms of times of day and length of stay may be reasonably similar. The intensity of daily and peak use was considered to be appropriate, and it would produce a robust PM peak assessment.

2.4.11 A copy of email correspondence with WSCC, from 1st October 2021, is provided as Appendix 1.8.

2.5 Technical Notes 3 and 4

2.5.1 ADL prepared Technical Note 3 (TN3) on 15th November 2021, which provided the following elements:

- Junction capacity assessment of each of the assessed junctions across the SCW transport study area, in the 2033 Baseline Scenario (i.e., no development);
- Junction capacity assessment of each of the assessed junctions across the SCW transport study area, in the 2033 Total Scenarios (i.e., 2033 Baseline Scenario minus Permitted Development, plus the four Proposed Development Scenarios);
- Where the proposed development scenarios result in the junction not operating within theoretical capacity (i.e., RFC value greater than 0.85), or significant increase in queue lengths when compared with the 2033 Baseline Scenario, ADL proposed mitigation in the form of junction improvements to alleviate potential traffic issues identified at certain arms of junctions;
- Any junction improvements were remodelled to test the extent to which the improved junction improvements can accommodate the proposed development scenarios without severe residual traffic impact; and
- Where off-site highways improvements were proposed as mitigation, a budget cost estimate was drawn up for each of the affected junctions.

2.5.2 The preparation of TN3 was supplemented by TN1, TN2, and subsequent discussions with SDNPA, WASS and NH. A copy of TN3 is provided as Appendix 1.9.

2.5.3 ADL met with SDNPA, WSCC and NH on 1st December 2021 to discussion TN3. Comments from NH have been taken into account within this TA, salient points raised are as follows:

- WSCC requested merge and diverge lane capacity assessment to be undertaken on A27**.**
- Assessment should include sustainable transport mitigation impacts on the junctions.
- ADL confirmed that except for Lancing Manor Roundabout highway improvements, all other junction improvements are within adopted highway.

- Sustainable Transport Mitigation should be those that the development would actually be able to provide. The development should not be dependent on possible measures that are likely to be put forward by third parties.
- Modelling assessment should be based on RFCs, queues, and average delay per vehicle.
- Whilst increase in delays on Washington Roundabout as a result of SCW developments is marginal it is a key junction and hence WSCC would expect this junction to be improved. WSCC are working on their own scheme at Washington Roundabout and a proportion of contribution as per the cost estimate within TN3 should be allocated towards.
- WSCC confirmed that there would be no need to improve the A283/Water Lane crossroads as any improvements are likely to result in an increase in rat-running along Water Lane which would not be desirable.
- A283 staggered junction with B2135 and Horsham Road to be assessed.
- Cost estimates to include optimism bias.
- WSCC would not be looking to make any physical improvements to the urban roundabouts to the south of the A27 i.e. A283/Upper Shoreham Road and A283/A259.
- Meeting is to be held on 8th December with the SDNPA to discuss site access options.
- A three-armed roundabout option would only provide access to the eastern part of the site. Therefore, based on ADL's initial assessment, there will be a need for a second three-armed roundabout access for the western part of the site.
- There is an option to provide left in left out junction for western part of the site instead of three-armed roundabout but would require widening of the tunnel.

2.5.4 The Notes of Meeting are provided as Appendix 1.10.

2.5.5 Technical Note 4 (TN4) undertakes a merge/diverge lane capacity assessment of the A27 slips with A283 roundabout using DMRB's CD122 *Geometric Design of Grade-Separated Junction* methodology. A copy of TN4 is provided as Appendix 1.11.

2.5.6 TN4 concludes that the required merge/diverge type does not alter between the 2033 baseline scenario and SCW development scenarios i.e., SCW development scenarios do not require any mitigation over and above what would be required for the 2033 baseline scenario.

2.5.7 In response to the meeting, ADL have included junction capacity assessment of the A283 junction with B2135 and Horsham Road. WSCC provided 2019 modelled flows in the absence of observed flows. The straight-ahead movements were found to be significantly lower than the 2019 observed flows at the Clays Hill Roundabout and Water Lane crossroad.

2.5.8 As such, to be robust it was agreed with WSCC to use the straight ahead flows on the A283 from the neighbouring junctions but maintain the turning movements to/from B2135 and Horsham Road. The junction capacity assessment of these junctions is included in Section 12.4.

2.5.9 Optimism bias has been considered for each of the budget cost-estimates for each of the junctions where mitigation is proposed. An optimism bias of 46% agreed with WSCC. This is included in Section 14.0.

2.5.10 As agreed with WSCC, instead of any physical improvements A283/Upper Shoreham Road roundabout and A283/A259 roundabout, the contribution stated in TN3 could be put forward towards improving sustainable transport infrastructure. A decrease of 2% of SCW Proposed Development Trips would be discounted to account for this.

2.5.11 The following site access arrangement for SCW have been tested for capacity using Junctions 9 modelling software:

- Two x all movement T-Junctions with A283;
- Two x left in/left out T-Junctions with A283, using tunnel beneath A283 to connect east and west portions of the site;
- Two x three-armed roundabouts;
- North Access (Left out/All in T-junction) and South Access (three-armed roundabout); and
- Four-armed roundabout.

2.5.12 Based on the junction capacity assessments of the above site access arrangements, the four-armed roundabout is the only option which works in terms of capacity. As such for the purpose of the Transport Study, the four-armed roundabout site access option has been brought forward. This is elaborated on in Section 12.0.

2.6 DMRB CD 116 Compliance Checks

2.6.1 As requested by NH, ADL undertook DMRB CD 116 (Geometric Design of Roundabouts) compliance checks the proposed improvements of the A283/A27 Slips Roundabout and A27/Grinstead Lane (Lancing Manor) Roundabouts. This considers the following parameters at each junction:

- Inscribed circle diameter
- Circulatory width
- Central island diameter, overrun area
- Splitter island width
- Flare lengths
- Entry widths, lane alignments, angles, path radii
- Exit widths, kerb radii
- Visibility on approaches, entries

2.6.2 The parameters of the proposed junction geometries, as designed by ADL, have been checked against the existing geometry of the A283/A27 Slips Roundabout, and against the committed junction arrangement of Lancing Manor Roundabout. These checks are tabulated and provided as Appendix 19.4, and 23.4, respectively.

2.6.3 The proposed junction designs meet all the CD 116 requirements, except for the following deviations, which can be justified:

A283/A27 Slips Roundabout:

- Exit Kerb Radius, Arm 3 (southeast) – no kerb radius (straight), however as per existing situation.
- Visibility on Approach, Arm 1 (northwest)– visibility is 94.0 metres, this is a significant improvement from the existing situation because the existing roundabout provides 78.0 metres visibility.
- Visibility on Approach, Arm 2 (northeast) – visibility is 96.0 metres, existing roundabout is 107 metres (reduction in forward visibility by 11 metre).
- Visibility on Approach, Arm 3 (southeast) – visibility is 69.4 metres, a significant improvement from the existing situation because the existing roundabout provides 50 metres visibility.

A27/Grinstead Lane (Lancing Manor) Roundabout:

- Entry width, Arm 3 – width is 11.6 metres, however, permitted roundabout design (NMF) has 11.2 metres, which is already above practical limit for single carriageway approach (i.e., 10.5 metres).
- Visibility on Approach, Arm 1 – visibility is 90.0 metres, Manor Road is 30mph and the speed limit changes to 40mph only 24 metres from the give-way. Hence, using 30mph as speed limit for approach, it meets the standards. Standard for 40mph approach speed limit is met by applying one-step below desirable minimum.
- Visibility on Approach, Arm 4 – visibility is 79.8 metres, which is the same as the permitted roundabout design from New Monks Farm.

2.6.4 It is summarised that the improvements meet CD 116 requirement for the majority of the parameters. For others, it is demonstrated that there would not be worsening of the junction safety when compared to the existing situation for A283/A27 Slips Roundabout, and to the permitted NMF's scheme for A27/Grinstead Lane Roundabout.

2.6.5 SDNPA provided comments via email on 9th February 2022, accepting the DMRB compliance checks, stating the only deviations are due to existing infrastructure, so deviating from standard shouldn't make things worse.

2.6.6 WSCC's provided their initial comments on A285/A27 slips roundabout via email on 16th February 2022, stating the following:

- ***"I note that the designers used the speed limit to calculate forward visibility. In my view, the SSD should be judged against the speed that cars are driving due to the curvature – see Equation from Annex B of "Provision of Road Restraint Systems on Local Authority Roads" UK Roads Liaison Group and DfT 2011. It is unlikely that motorists will be driving at national speed limit on the slip roads. Alternatively, measured speeds might inform the design.***

WSCC recommend that stopping sight distances for forward visibility are assessed based on the curve design speeds.

- ***The designers will need to review accidents statistics at the roundabout and their possible causes. There appears to be a few injury accidents which are almost exclusively to do with the shallow entry angles. Approaching drivers are looking over their shoulders at circulating traffic to anticipate their go/no-go decision and then colliding with drivers waiting at the give way line. This could be effectively countered by the use of visibility screening at arms 1, 3 and 4 like the ones WSCC installed at A24 Southwater. Drivers would then be more likely to look where they are going until they are much closer to the give way line. I note that the proposals for Arm 2 provide a major improvement in entry angle to the extent that such screening is not necessary here. However, let's let the designer decide what measures they propose to counter accidents they will identify after analysing the accident trends.***

Section 4.0 of this TA provides detailed study of accidents at both roundabouts. It is noted that visibility screening would provide effective mitigation against this for Arms 1, 3 and 4.

- ***Looking at the Design Audit spreadsheet, the designers seem to have captured most of them and I haven't picked up additional ones. However, what they have not provided is a plan that shows the available forward visibility splays and the required splays. They will also need to identify the constraints that stand in the way of achieving the required forward visibility splays.***

The forward visibility has been reviewed based on the curve design speeds, using the equation from Annex B of *Provision of Road Restraint Systems on Local Authority Roads* UK Roads Liaison Group and DfT 2011. For the purpose of calculation, crossfall values for all approaches is assumed as zero due to the minimal observed crossfalls. Based on this, the resultant curve design speed for Approaches 1, 2 and 3 were calculated as 31km/hr, 20km/hr and 24km/hr respectively. Such low speeds would require far less forward visibilities than that provided in paragraph 2.6.3. It should be noted that the calculated curve design speeds are much lower than expected and hence, further assessment in terms of undertaking speed surveys on the approaches may be required at a later stage. It is agreed that appropriate visibility screening measures would be proposed to resolve any concerns associated with accidents on the approaches.

- ***In my view, the road safety audit needs to be undertaken and submitted to us to inform the design review"***

It is considered that, as these are outline drawings for the initial AAP assessment, Stage 1 Road Safety Audit (RSA) and Walking, Cycling and Horse-Riding Assessment (WCHAR) would be undertaken either at individual planning application stage or the later stage of AAP. This approach is not unique and is generally applied to AAP and Local Plan studies.

2.6.7 At the time of producing this report (April 2022), ADL are awaiting review of these proposed junction improvements from National Highways. Until such time, it has been agreed by SDNPA that these compliance checks would be reviewed further in due course.

2.6.8 It is acknowledged that a Stage 1 RSA and WCHAR have not been undertaken, this adds a layer of uncertainty. Stage 1 RSA and WCHAR will be undertaken going forward to resolve possible risk to achieving successful design within highway constraints.

3.0 SITE AND SURROUNDING AREA

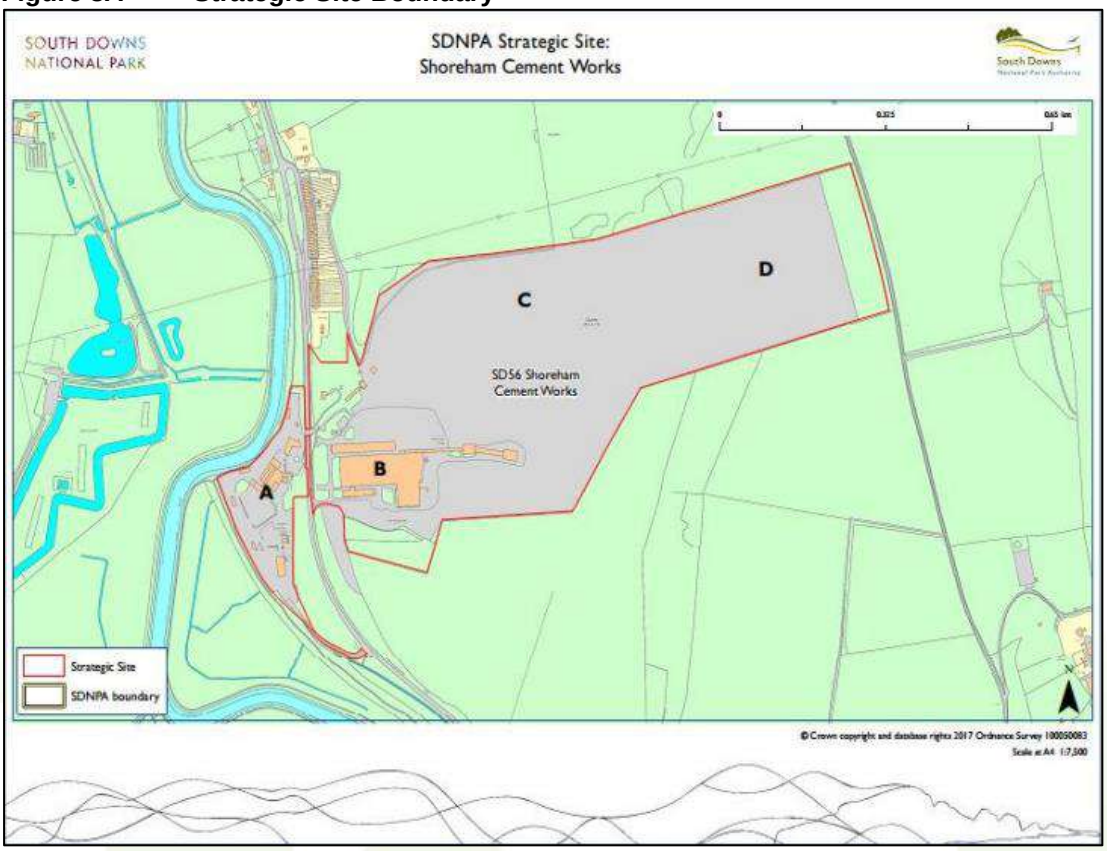
3.1 Site Location

3.1.1 Shoreham Cement Works (the 'Site') is approximately 44-hectare portion of land including a semi-derelict cement works, inactive chalk quarry, temporary inert recycling facility and a mix of temporary business uses.

3.1.2 The site is located on both sides of the A283 Steyning Road, approximately five kilometres north of Shoreham-by-Sea and two kilometres south of Upper Beeding and Steyning. The site location is provided as Appendix 2.0.

3.1.3 The strategic site boundary is shown in Figure 3A below.

Figure 3A Strategic Site Boundary



3.1.4 Large-scale cement production began on the site at the end of the 19th Century. The buildings were completed in 1948-50, permission having first been granted for chalk extraction in 1946. Chalk extraction and cement production ceased in 1991, but the permission (for Area C) was kept alive by an application for registration of the old mining permission in 1992. This extant permission for the extraction of chalk runs to 2042, when a basic restoration scheme would have to be implemented.

3.1.5 Existing use rights exist for general industrial uses within existing buildings and for associated uses (such as storage) taking place in the open air. Areas A and B can be classed as brownfield land, but not Areas C and D, since minerals sites are excluded from the NPPF definition of previously developed land.

3.1.6 The site is located wholly within the South Downs National Park (SDNP). The whole site is in single private ownership and the SDNPA is the sole Local Planning Authority.

3.2 Local Highway Network

Existing Site Accesses

3.2.1 The site lies either side of the A283 Steyning Road. The northern access, to the eastern portion of the site, is a left in/left out priority T-junction. It is approximately 45 metres wide where is meets the A283 and narrows to approximately ten metres. The site access roads within this portion of the site are approximately 5.5 metres wide.

3.2.2 The southern access, to the western portion of the site, is an all-movements priority T-junction. It is approximately 40 metres wide at the A283 and narrows to approximately 5.5 metres wide.

3.2.3 The two portions of the site are connected by an underpass beneath the A283. The carriageway width at this point is approximately 5.6 metres wide (this includes 1.4-metre-wide footway). The headroom height of the tunnel is approximately 4.4 metres high, and the length of the tunnel is approximately 25 metres.

A283 Steyning Road

3.2.4 The A283 is a single carriageway road, approximately seven metres wide and subject to national speed limit, i.e., 60mph.

3.2.5 In the vicinity of the site, the A283 runs in a north-south direction, broadly parallel to the River Adur. The A283 connects the site with Shoreham-by-Sea to the south, and Storrington to the northwest.

3.3 Broader Highway Network: A283

A283 (South of the Site)

3.3.1 Approximately 2.3 kilometres south of the site, the A283 meets the A27 slips at a four-arm roundabout. To the south of this roundabout, the A283 leads to Shoreham and then the A259. Approximately 500 metres south of the A27 roundabout, the speed limit is reduced to 30mph.

3.3.2 Approximately 3.1 kilometres south of the site, the A283 meets Upper Shoreham Road at a three-arm mini roundabout, which leads through Shoreham, up to the Holmbush Roundabout (with A270). On all approaches, the roads are approximately 7.0 – 8.5 metres wide.

3.3.3 Approximately 4.1 kilometres south of the site, the A283 meets the A259 at a three-arm roundabout. The A259 which leads to South Lancing the west, and along the south of Shoreham to the east. On all approaches, the roads are approximately 6.5 – 10.0 metres wide.

A283 (North of the Site)

3.3.4 Approximately 1.2 kilometres north of the site, the A283 meets the A2037 Shoreham Road at a three-arm roundabout. The A2037 is a single carriageway road, approximately 8.0 metres wide, which leads to the village of Upper Beeding, and beyond to Henfield.

3.3.5 Approximately 2.6 kilometres north of the site, the A283 meets a six-arm roundabout with Clays Hill, Mauldin Lane, Castle Lane, and The Steet. The speed limit is reduced to 30mph at the roundabout. The Maudlin Lane, Clays Hill and Castle Lane arms of the roundabout provide link to different areas of Steyning, whilst The Street leads to Bamber and Upper Beeding.

3.3.6 Approximately 5.5 kilometres north of the site, the A283 meets B2135 Horsham Road at a left-right staggered junction. Horsham Road, north of the A283 is approximately 6.6 metres which leads to Ashurst and Partridge Green, and eventually the A24, approximately 1.3 kilometres south of the A272. Horsham Road south of the A283 is approximately 6.0 metres wide and leads to Steyning High Street.

3.3.7 Approximately 8.3 kilometres north of the site, the A283 meets Water Lane and Chanctonbury Ring Road at a simple crossroads junction. Water Lane is a rural road, with a width of approximately 4.5 metres which leads to Ashington, and A24. Chanctonbury Ring Road is a rural road which leads to a small number of residential dwellings and provides access to the South Downs Way.

3.3.8 Approximately 11.0 kilometres northwest of the site, the A283 meets the A24 at a four arm-roundabout (known as Washington Roundabout). The A283 west of the roundabout leads to Storrington. The A24 is a dual carriageway road which leads to Worthing to the south and Horsham to the north.

3.4 Broader Highway Network: A27 Shoreham By-Pass

3.4.1 The A27 in the vicinity of the site forms part of the strategic road network. It is a key east-west link providing access between Brighton, Shoreham, Lancing, and Worthing.

3.4.2 Within the vicinity of Shoreham, the A27 is a dual carriageway providing two lanes in either direction with a speed limit of 70mph. The carriageway in the vicinity of the site is straight with good forward visibility.

3.4.3 Approximately 700 metres west of the A27 Slips to the A283 roundabout, the A27 is met by Old Shoreham Road and Coombes Road at a staggered signal crossroads. At this point, the A27 widens to three lanes.

3.4.4 Old Shoreham Road is approximately 6.7 metres wide and leads to Shoreham to the east. Coombes Road is approximately 7.1 metres wide and leads to Lancing College. This junction configuration is to be upgraded to a signalized four arm roundabout as part of the New Monks Farm development. This is detailed in Section 3.5.

3.4.5 Approximately 2.4 kilometres west of the A27 Slips to the A283 roundabout, the A27 meets the A2025 Grinstead Lane and Manor Road at a four-arm roundabout (known as the Lancing Manor Roundabout).

3.4.6 The Lancing Manor roundabout includes two lanes on the A27 approach arms with two lanes continuing around the circulatory carriageway. The circulatory carriageway also includes 'Keep Clear' markings to ensure that entry arms are not blocked. On the Grinstead Lane and Manor Road arms, the approaches consist of single lanes which then flare to separate turning movements at the junction.

3.4.7 Grinstead Lane is a single carriageway road approximately 9.5 metres wide and leads to Lancing / South Lancing. Manor Road is a single carriageway road approximately 9.3 metres wide and leads to North Lancing.

3.5 Committed Highways Works

Access to New Monks Farm/Shoreham Airport Development

3.5.1 Access to the New Monks Farm/Shoreham Airport development is to be gained via a new signalised roundabout on the A27. This builds on the principles noted in the Adur Local Plan Submission (2016) and associated technical traffic assessments which informed the emerging Plan. Specifically, this includes:

- A new, high capacity, signalised roundabout on the A27 fronting the New Monks Farm development site;
- A new 50mph speed limit on the A27 on approach to, and including, the new signalised roundabout;
- Internal roundabout with a link to the New Monks Farm development (west);
- A link east (Airport Link Road) from the internal roundabout to Old Shoreham Road, which will provide access to Shoreham Airport and Ricardo Engineering;

- Removal of the existing Old Shoreham Road traffic signal-controlled junction with the A27;
- Removal of the existing Coombes Road traffic signal operation with access retained via a left in/left out arrangement from the eastbound A27 carriageway, allowing access to Lancing College and the South Downs National Park; Removal of the two existing accesses on the A27 to the Withy Patch Gypsy and Travellers Site, with the relocation of this site to be accessed from the Airport Link Road;
- Retention of the existing off-carriageway foot/cycle links along the southern side of the A27;
- Creation of a new off-carriageway foot/cycle link along the northern side of the A27 linking to Hoe Court and Lancing College;
- Provision of at-grade Toucan crossing facilities at the new roundabout retaining controlled crossing facilities on the A27 for north-south movements;
- Creation of new off-carriageway foot/cycle links as part of the internal road layout, providing an alternative route away from the A27;
- Consideration of an upgrade of the existing public footpath (PRoW Ref: 2049) to a bridleway, thereby providing an additional north-south link for the benefit of leisure trips; and
- Inclusion of a new foot/cycle link into the site from the existing Mash Barn estate, which can also serve as an alternative emergency vehicle access.

3.5.2 A plan of the committed A27 Old Shoreham Road improvements for New Monks Farm development access and Sussex Pad works, drawing number VN40408/PL-015 (Revision A) prepared by Vectos, is provided as Appendix 3.1.

3.5.3 Subsequently, additional highway works comprising construction of a Fourth Arm from the approved New Monks Farm A27 roundabout to Coombes Road (west) and; closure of the existing Coombes Road (east) junction with the A27 has been approved in October 2021 (planning ref. AWDM/1906/20).

3.5.4 A plan of the committed roundabout improvements, drawing number VN201557/PL-03 (Revision J) prepared by Vectos, is provided as Appendix 3.2.

A27 / Grinstead Lane Roundabout

3.5.5 As part of the New Monks Farm/Shoreham Airport development, mitigation was proposed at the A27/Grinstead Lane roundabout to accommodate development traffic and improve the operation of the strategic road network. This is in the form of additional lanes on the A27 arms, increased flare lengths, signage and lane markings to advise drivers of the lanes that can be used to complete certain manoevures.

3.5.6 An agreement between Highways England (now National Highways) and Adur District Council and the New Monks Farm applicant requirement that the Monks Farm applicant either enters into a S278 Agreement to undertake traffic improvements to the Lancing Manor Roundabout in accordance with Vectos' drawing number VN40408/PL-010 or pays contributions in full for the cost of the works. The junction improvements as per Vectos' drawing number VN40408/PL-010 is therefore regarded as 'committed highway improvements' and are therefore used to assess the baseline as well as development scenario traffic impact associated with Shoreham Cement Works study.

3.5.7 A plan of the committed roundabout improvements, drawing number VN40408/PL-010 (Revision D) prepared by Vectos, is provided as Appendix 3.3.

4.0 ROAD SAFETY STUDY

4.1 Scope of Road Safety Study

4.1.1 ADL obtained official accident data from WSCC for the latest five-year period up to the first Covid-19 lockdown – i.e., 1st April 2015 – 31st March 2020. This period of time was advised by WSCC.

4.1.2 As advised by WSCC, the extent of the search included each of the 12 junctions as well as the links between them.

4.1.3 The first pass through the safety study is a high-level statistical analysis to identify clusters of accidents at particular locations and to examine the accident rates along links in comparison with national averages for the same type of road.

4.1.4 Then, these cluster locations are correlated with where the trip distributions for generated trips to/from the proposed development are showing a significant increase in flows through locations (junctions or links) where the existing accident record is of concern compared to what might be reasonably expected from its level of use.

4.2 Network Overview

4.2.1 Across the study area, which comprises approximately 18.5 kilometres of highway, there were a total of 269 personal injury accidents, which involved a total of 556 vehicles, and 380 casualties (i.e., pedestrian, cyclists, rider, passenger, or driver).

4.2.2 A plot of these accidents is provided as Appendix 4.1. Table 4A summarises the accidents by year.

Table 4A Accident Severity by Year

Severity	Year						Total
	2015 April - December	2016	2017	2018	2019	2020 January - March	
Fatal	0	0	1	0	0	0	1
Serious	10	11	6	9	12	4	52
Slight	38	52	41	36	43	6	216
Damage	0	0	0	0	0	0	0
Total	**48**	**63**	**48**	**45**	**55**	**10**	**269**

4.2.3 Of the 269 accidents, approximately 80% resulted in slight injury; whilst 20% of the collisions were Killed or Seriously Injured (KSI) – 19% resulted in serious injury, and less than 1% resulted in fatality. This is equal to the national average of 19%, based on the Department for Transport accident statistics for the same period.

4.2.4 Table 4B summarises the accidents by Junction Type and Table 4C summarises the accidents by road type.

Table 4B Accident by Junction Type

Severity	Number	%
Slip Road	19	7%
Multiple Junction	1	0%
Other Junction	1	0%
Crossroads	11	4%
Not at Junction	97	36%
Private Drive	11	4%
Roundabout and Mini	68	25%
T or Staggered	61	23%
Total	**269**	**100%**

Table 4C Accident by Road Type

Speed Limit		Number	%
Urban / Built Up Roads	20mph	3	1%
	30mph	53	20%
	40mph	27	10%
	Sub Total	***83***	***31%***
Rural / Non-built-up roads	50mph	15	6%
	60mph	103	38%
	70mph	68	25%
	Sub Total	***186***	***69%***
Total		**269**	**100%**

4.2.5 Table 4B demonstrates that the 36% of accidents on links between roads not at a junction; 25% of accidents occurred at roundabouts; and 23% of accidents occurred at T or staggered junctions. Table 4C demonstrates that the majority of the accidents occurred on non-built-up roads (69%) and fewer accidents occurred on built up roads (31%) – this also reflects the national average. The accident summary data is provided as Appendix 4.2.

Collision Cluster Analysis

4.2.6 Based on the *Adur Local Plan Second Addendum: Revised Reissue September 2016 Transport Study*, a cluster of collisions is defined as eight of more collisions within a 60-metre diameter, over the five-year study period.

4.2.7 Using this methodology, across the Shoreham Cement Works transport study area, one cluster site has been identified as having eight or more collisions in five the year period. The locations of the collision clusters are listed as follows:

- A283/A27 slips roundabout, A283 North arm approach (10 collisions);

A plan of this collision cluster is provided as Appendix 4.3.

4.2.8 This collision cluster between the A283/A27 slips roundabout, on the A283 north arm approach has been investigated further. The full reports for each of these collisions is provided as Appendix 4.4. A summary is provided in Table 4D.

Table 4D Accident Details: Cluster at A283/A27 slips roundabout, A283 North arm approach

Ref	Severity	No. Veh	No. Cas	Date	Time	Cause(s)
1604996	Serious	2	1	18/08/2016	16:01	1. Failed to judge other person's path/speed (Driver/Rider - Error)
1606787	Slight	2	2	11/11/2016	14:20	1. Failed to look properly (Driver/Rider - Error) 2. Failed to judge other person's path/speed (Driver/Rider - Error)
1703357	Slight	2	2	18/06/2017	18:30	N/A
1704775	Slight	3	1	23/08/2017	18:00	1.Failed to judge other person's path/speed (Driver/Rider - Error)
1800093	Slight	2	5	06/01/2018	10:17	1. Failed to look properly (Driver/Rider - Error)
1806033	Slight	2	1	01/11/2018	13:31	1. Failed to look properly (Driver/Rider - Error)
1807174	Slight	2	1	24/12/2018	09:19	N/A
1902466	Slight	2	1	13/05/2019	15:45	1. Careless/Reckless (Driver/Rider - Behaviour) 2. Junction overshoot (Driver/Rider - Error) 3. Nervous/Uncertain (Driver/Rider - Behaviour)
852932	Slight	2	3	01/07/2019	10:30	1. Sudden braking (Driver/Rider - Error) 2. Failed to judge other person's path/speed (Driver/Rider - Error) 3. Following too close (Driver/Rider - Injudicious) 4. Failed to look properly (Driver/Rider - Error)
896395	Serious	2	1	07/11/2019	16:49	1. Aggressive driving (Driver/Rider - Behaviour) 2. Exceeding speed limit (Driver/Rider - Injudicious)

4.2.9 Table 4D demonstrates that of these ten collisions, six involved a vehicle which either failed to judge other persons path or speed, failed to look properly, or sudden braking (i.e., driver/rider error); two involved vehicles whose driver/rider was careless/reckless (i.e., driver/rider behaviour); and one involved a vehicle exceeding the speed limit (i.e., driver/rider injudicious).

4.2.10 A study by Loughborough University (Wang, 2010) found that traffic congestion is positively associated with the frequency of fatal and serious injury accidents. Hence, the causes of collisions could be a result of drivers taking higher risks when congestion reaches higher conditions.

4.2.11 As detailed in Section 12.0 ADL have proposed junction improvements at the A283/A27 Slips roundabout, which includes widening and of the A283 North arm, dedicated left hand lane for A27 Eastbound traffic; and lane direction road markings. It is therefore considered that the accident situation would be improved should these improvements be implemented.

4.3 Assessed Junctions

4.3.1 The cluster analysis demonstrates that there are no collision clusters (i.e., eight or more collisions within 60 metres) on the other junctions (other than one discussed in Section 4.2) that are being assessed within the scope of this transport study, nor on any of the links between them.

4.3.2 However, for completeness, the accident situation at each of the assessed junctions have been analysed. The number and severity of accidents which have occurred at each of the junctions within this transport study are summarized in Table 4E.

Table 4E Accidents at Assessed Junctions

Junction		Severity			Total
		Slight	Serious	Fatal	
1	Washington Roundabout	19	1	0	20
2	A283 / Water Lane	5	2	0	7
3	A283 / B2135 Junction	3	1	0	4
4	A283 / Clays Hill Roundabout	6	0	0	6
5	A283 / A2037 Roundabout	4	1	0	5
6	Site Access (North)	0	0	0	0
7	Site Access (South)	2	0	0	2
8	A283 / A27 Slips Roundabout	21	5	0	26
9	A283 / Upper Shoreham Road Roundabout	2	0	0	2
10	A283 / A259 Roundabout	4	0	0	4
11	A27 / New Monks Farm Committed Roundabout (Based on existing A27 / Old Shoreham Road / Coombes Road junctions)	15	4	0	19
12	Lancing Manor Roundabout	9	0	0	9
Total		**90**	**14**	**0**	**104**

4.3.3 Based on the previous threshold of eight collisions, Table 4E demonstrates that the accident rate at Junctions 2, 3, 4, 5, 6, 7, 9, and 10 do not require any further in-depth analysis. However, Table 4E demonstrates that the following junctions require further analysis to understand the nature of accidents which are occurring:

- Junction 1: Washington Roundabout
- Junction 8: A283/A27 Slips Roundabout
- Junction 11: A27/Old Shoreham Road/Coombes Road T-Junctions
- Junction 12: Lancing Manor Roundabout

4.3.4 At each of these four junctions, the casual factors for the collisions and the specific arm on which they occurred has been investigated.

Junction 1: Washington Roundabout

4.3.5 At the Washington Roundabout, 20 accidents were recorded, of which 19 were slight severity and one was serious. Of the 20 accidents, 46 vehicles were involved and 27 casualties were recorded. The causation factors are summarised for each arm of the junction, and circulatory lanes, in Table 4F.

Table 4F Accident Details: Washington Roundabout

Cause		Arm					Total
		A283 West	A24 North	A283 East	A24 South	Circulatory Lane	
Driver / Rider - Error	Failed to judge other person's path/speed			2	3	3	8
	Failed to look properly	1		2	2		5
	Sudden braking				1		1
	Junction restart			1			1
Driver / Rider - Behaviour	Inexperience with vehicle type			1			1
	Careless/Reckless	1				1	2
Driver / Rider - Injudicious	Following too close			1			1
	Disobeyed give way or stop sign markings			1			1
	Travelling too fast for conditions			1			1
Total		**2**	**0**	**9**	**6**	**4**	**21**

Not all accident reports provided causation factor

4.3.6 Table 4F demonstrates that the most common cause of accident was failure to judge other persons path/speed (8), followed by failure to look properly (5). Driver/rider error is therefore considered to be the prevailing issue regarding accidents at this junction.

Junction 8: A283/A27 Slips Roundabout

4.3.7 At the A283/A27 Slips roundabout, 26 accidents were recorded, of which 21 were slight severity and five were serious. Of the 26 accidents, 52 vehicles were involved and 37 casualties were recorded. The causation factors are summarised for each arm of the junction in Table 4G.

Table 4G Accident Details: A283/A27 Slips Roundabout

Cause		Arm				Total
		A283 North	A27 Eastbound Slips	A27 Westbound Slips	A283 South	
Driver / Rider - Error	Failed to judge other person's path/speed	6	2			8
	Failed to look properly	5	3	2		10
	Sudden braking	1				1
	Junction restart			1		1
	Loss of control			1	1	2
	Poor turn or manoeuvre	2				2
	Junction overshoot	1				1
Driver / Rider - Behaviour	Careless/Reckless	1	1	1	1	4
	Aggressive driving	2			1	3
	Nervous/Uncertain	1			1	2
	Inexperienced or learner driver/rider				1	1
Driver / Rider - Injudicious	Following too close	1				1
	Exceeding speed limit	1			1	2
Driver / Rider Impairment	Illness or disability, mental or physical			1		1
Total		**21**	**6**	**6**	**6**	**39**

Not all accident reports provided causation factor

4.3.8 Table 4G demonstrates that the most common cause of accident was failure to look properly (10) followed by failure to judge other persons path/speed (8). Driver/rider error is therefore considered to be the prevailing issue regarding accidents at this junction.

Junction 11: A27/Old Shoreham Road/Coombes Road T-Junctions

4.3.9 At the existing A27 junction with Old Shoreham Road and Coombes Road, 19 accidents were recorded, of which 15 were slight severity and five were serious. Of the 19 accidents, 44 vehicles were involved and 32 casualties were recorded. The causation factors are summarised for each arm of the junctions in Table 4H.

Table 4H Accident Details: A27 / Old Shoreham Road / Coombes Road

Cause		Arm				Total
		A27 Westbound (at Coombes Road)	A27 Westbound (at Old Shoreham Road)	A27 Eastbound (at Old Shoreham Road)	A27 Eastbound (at Coombes Road)	
Driver / Rider - Error	Failed to judge other person's path/speed	3	1	3	2	**9**
	Failed to look properly	2		3		**5**
	Sudden braking	1				**1**
	Poor turn or manoeuvre				1	**1**
Driver / Rider - Behaviour	Careless/Reckless	2			2	**4**
Driver / Rider - Injudicious	Following too close	1			1	**2**
	Travelling too fast for conditions			1		**1**
Driver / Rider Impairment	Uncorrected, defective eyesight	1				**1**
Road Environment Contributed	Deposit on road e.g., oil, mud, chippings				1	**1**
Total		**10**	**1**	**7**	**7**	**25**

Not all accident reports provided causation factor

4.3.10 Table 4H demonstrates that the most common cause of accident was failure to judge other persons path/speed (9) followed by failure to look properly (5). Driver/rider error is therefore considered to be the prevailing issue regarding accidents at these junctions.

4.3.11 It should be noted that this junction arrangement is due to be improved as per the New Monks Farm committed development. A new four-arm signalized roundabout is committed, as described in Section 3.5. Based on this, it is to be expected that the accident situation would be improved, and by closing off both off these junctions on the A27, it is expected that the accident rate would be reduced.

Junction 12: Lancing Manor

4.3.12 At the Lancing Manor Roundabout, nine accidents were recorded, of which all were slight severity. Of the nine accidents, 18 vehicles were involved, and ten casualties were recorded. The causation factors are summarised for each arm of the junction, and circulatory lanes, in Table 4I.

Table 4I Accident Details: Lancing Manor Roundabout

Cause		Arm					Total
		A27 East	Grinstead Lane	A27 West	Manor Road	Circulatory Lane	
Driver / Rider - Error	Failed to judge other person's path/speed		2			1	**3**
	Failed to look properly					1	**1**
	Poor turn or manoeuvre	1					**1**
Driver / Rider - Behaviour	Aggressive driving	1					**1**
Total		**2**	**2**	**0**	**0**	**2**	**6**

Not all accident reports provided causation factor

4.3.13 Table 4H demonstrates that the most common cause of accident was failure to judge other persons path/speed (3). Four of the nine accidents were not provided with a causation factor, however, based on the description of the accident, one accident was the result of an undertake manoeuvre; one accident involved a pulling out onto roundabout as cyclist is circulating, one accident involved a shunt as a result of a driver waiting for a gap in traffic; and one accident was the result of a motorcycle filtering along the side of queuing traffic, hit by vehicle moving across to left hand lane.

4.3.14 It is therefore considered that the majority of accidents at this junction were the result of driver/rider error. The Lancing Manor Roundabout has committed junction improvements as part of the New Monks Farm development. ADL have also proposed further improvements to this junction to increase the capacity of the junction which is expected to improve the accident situation.

4.4 Conclusion

4.4.1 ADL have investigated the official accident data provided by WSCC for the latest five-year period across the SCW transport study area.

4.4.2 A total of 269 accidents occurred, of which 19% were KSI, which is equal to the national average. By defining a collision cluster as at least eight accidents within 60 metres in the five-year period, one collision cluster has been identified. However, only the A283/A27 Slips roundabout, where the A283 North arm meets the roundabout, has been investigated.

4.4.3 ADL have also investigated the collisions across the 12 junctions assessed as part of this transport study. Of the 12 junctions, four have recorded eight or more collisions, and the causation factors at each of these junctions have been analysed.

4.4.4 ADL have proposed mitigation in the form of junction improvements to alleviate potential traffic issues identified at certain arms of junctions, as a result of the proposed development scenarios. These improvements would improve the capacity of the junction, as well as theoretically improving the accident situation. There are also committed junction improvements as part of the New Monks Farm development, which is expected to improve the accident situation on the A27.

4.4.5 It is also noted that any proposed capacity mitigation measures (either committed or proposed by ADL) would need to undergo Road Safety Audits during detailed design and following construction. These audits would consider current collision problems as well as consider any additional safety problems that might arise from the design.

5.0 PERMITTED VEHICULAR TRIP GENERATION

5.1 As mentioned previously, the permitted uses of the site, and their associated trip generation has been detailed in TN1.

5.2 SDNPA's Major Projects Head provided the following information regarding existing permitted uses on site that have been active during the last five years:

East of A283 (main cement works site)

- Site area = 6.23 hectares
- Importation, storage, and treatment if inept material to produce recycled/secondary aggregate
- 50,000 tonnes per annum between hours 07:00 and 18:00 weekdays and 07:00 and 13:00 Saturdays
- Maximum daily movements = 100 HGVs but may be as low as 10

West of A283

- Site area = 3.45 hectares
- Vehicle repair, coach and bus parking, scrap recycling, scaffold storage etc.
- Use Classes B1, B2 and B8 including residential security, caravan.
- 30 businesses employing 150 people

5.3 Based on the above information provided by SDNPA, the cement works site (east of the A283) generates a maximum of 100 HGV movements (i.e., 50 inbound and 50 outbound) on a weekday. Typical peak hour trips (AM and PM peak hours) equate to 10% of the daily trips.

5.4 Therefore, the cement works site would generate:

- AM Peak (08:00 – 09:00): 10 HGV movements (i.e., 5 inbound and 5 outbound)
- PM Peak (17:00 – 18:00): 10 HGV movements (i.e., 5 inbound and 5 outbound)

5.5 With regards to the part of the site to the west of the A283, planning permission SDNP/20/00110/CND was granted on 6th July 2020 which would allow the site to be used for purposes falling with use classes B1, B2 and B8 (business, industry and storage) until 31st January 2025.

5.6 It is noted that there are 30 businesses on this part of the site. The list of these businesses was included as part of the 2015/15 planning application. These are provided in Table 5A.

Table 5A Occupants of The Site to the West of A283

Plan Ref	Parcel Description	Occupier Name	Nature Of Business	Description Of Use/Activities	Area (Sqm)
1	Container & Hardstanding #27	Peter Taylor	Vehicle recovery	Hardstanding for vehicle storage and a container for the storage of innate material	444
2	Garage Bays 1 & 2	Martin Memory	Mechanic	Garage bay for vehicle repair and adjoining area for vehicle parking	150
3	Garage Bay 3	Vantech Sussex Limited - Chris Carpenter	Mechanic	Garage bay for vehicle repair and adjoining area for vehicle parking	75
4	Garage Bay 4	Vantech Sussex Limited - Chris Carpenter	Mechanic	Garage bay for vehicle repair and adjoining area for vehicle parking	75
5	Garage Bay 5	Ace Travel Ltd	Coach operator	Garage bay for vehicle repair and adjoining area for vehicle parking	75
6	Garage Bay 6 & Container 5	Brightonian & Ocean Coaches - Peter Woodcock	Coach operator	Garage bay for vehicle repair and a container for the storage of innate material	194
7	Garage Bay 7	Heritage Travel	Coach operator	Garage bay for vehicle repair and adjoining area for vehicle parking	75
8	Garage Bay 8	Neil Bird t/a Southern Transit	Bus & coach operator	Garage bay for vehicle repair and adjoining area for vehicle parking	75
9	Hardstanding #1	Vantech Sussex Limited – Chris Carpenter	Mechanic	Hardstanding for coach parking/storage	525
10	Hardstanding #2	Heritage Travel - as 7 (same lease)	Coach operator	Hardstanding for vehicle parking/storage	640
11	Hardstanding #3	C Jenkin & Son	Mobile Home dealer	Hardstanding for mobile home storage	1193
12	Hardstanding #4	Neil Bird t/a Southern Transit	Bus & coach operator	Hardstanding for bus & coach parking/storage	1139
13	Hardstanding #5	Crawley Luxury Coaches - Dave Brown	Coach operator	Hardstanding for coach parking/storage	76
14	Hardstanding #7	Jason Hodge	Scrap/recycling operator	Enclosed yard for the storage of recyclable material	1132
15	Hardstanding #9	S. Holman & C. English	storage of coaches	Hardstanding for coach parking/storage	410
16	Hardstanding #10A & B	J Messham	storage of equipment	storage of Wall of Death equipment	1252
17	Hardstanding #12	Neil Bird t/a Southern Transit	Bus & coach operator	Hardstanding for bus & coach parking/storage	197
18	Hardstanding #13	David Savage	Scrap/recycling operator	Hardstanding for vehicle parking/storage and storage of a boat	49
19	Hardstanding #15	Dave Hunt t/a DSH Leisure	Fairground ride operator	Hardstanding for fairground rides	496
20	Hardstanding #17	Ryan Cunningham	Car storage	Yard and building for paving slab and vehicle storage	207

21	Hardstanding #18	C Jenkin & Son	Mobile Home dealer	Hardstanding for mobile home storage	2009
22	Hardstanding #21	Nigel Crickmore	Vehicle recovery	Hardstanding for vehicle parking/storage	87
23	Hardstanding #22	Steven Wright	Scrap/recycling operator	Hardstanding for vehicle parking/storage	80
24	Hardstanding #23	Avery Howell & Oliver Glover	Vehicle recovery	Hardstanding for vehicle parking/storage	342
25	Hardstanding #25	Neil Bird t/a Southern Transit	Bus & coach operator	Hardstanding for bus & coach parking/storage	634
26	Hardstanding #28	Kristian Dutton	Scrap/reclamation operator	Hardstanding for vehicle parking/storage and an office for associated uses	603
27	Loading Bay	Philip Malkin	Vehicle storage	Yard and building for vehicle storage	410
28	Loco Shed	Ace Travel Ltd	Coach operator	Garage bay for vehicle repair and adjoining hardstanding for vehicle parking	384
29	Packing Plant	Scaffold It (UK) Limited	Scaffolding Company	Yard and building for scaffold storage	917
30	Hardstanding #10C	DC Geoghegen Ltd	Builders	Storage of building materials & skips	

5.7 Table 5A shows that 1,698 sqm area is occupied by vehicle recovery and repair businesses, 8,970 sqm area is used for vehicle storage (cars/coaches/buses), including by mobile home sales company and, 2,781 sqm is occupied by general industrial units. This matches well within the information provided by SDNPA's Major Projects Head (see paragraph 5.2).

5.8 For the purpose of estimating trip generation, vehicle repair garages, commercial warehousing and industrial units are the sub-land uses within TRICS would be chosen. The TRICS reports are provided as Appendices 5.1, 5.2, and 5.3, respectively. The weekday peak hour trip rates and vehicular trips is provided in Table 5B.

Table 5B Permitted Development to West of A283

Use	Time	Trip Rate per 100sqm		Vehicle Trips		
		In	Out	In	Out	2-way
Vehicle Repair Garages	08:00-09:00 17:00-18:00	1.220 0.530	0.670 0.850	27 9	11 14	38 23
Commercial Warehousing	08:00-09:00 17:00-18:00	0.217 0.078	0.097 0.224	19 7	9 20	28 27
Industrial Unit	08:00-09:00 17:00-18:00	0.509 0.044	0.087 0.479	14 1	2 13	16 14
Total	**08:00-09:00 17:00-18:00**			**60 17**	**22 47**	**82 64**

5.9 The total permitted vehicular trip generation associated with the entire site is provided in Table 5C.

Table 5C Total Permitted Vehicular Trip Generation

	Peak Hour	In	Out	Two-way
Cement Works Site	08:00-09:00 17:00-18:00	5 5	5 5	10 10
West of A283	08:00-09:00 17:00-18:00	60 17	22 47	82 64
Total	**08:00-09:00** **17:00-18:00**	**65** **22**	**27** **52**	**92** **74**

5.10 Table 5C shows that the overall permitted vehicular trip generation associated with the entire site is estimated to be 92 and 74 two-way vehicular movements during AM and PM peak hours, respectively. These trips were accepted by SDNPA, WSCC and NH.

5.11 As discussed in TN1, the vehicular trips associated with the permitted used of the site would be distributed across the road network accordingly to 2011 O-D census data and Mobile Network Data.

5.12 The permitted development traffic flows are shown diagrammatically as Appendix 5.4 and 5.5 for the AM and PM peak hours, respectively.

6.0 BASELINE TRAFFIC SITUATION

6.1 Raw Traffic Data

6.1.1 NH advised that it would not be acceptable to use of data from the Worthing and Shoreham Harbour strategic models for the SCW transport study. This is because neither model is up-to-date and therefore not considered to be sufficiently robust for SCW. A bespoke approach was therefore advised – as per email on 2nd August 2021.

6.1.2 The use of traffic surveys undertaken in 2021 was also deemed to be an unacceptable approach due to unknowns regarding traffic levels in the post-Covid period.

6.1.3 Therefore, WSCC provided observed traffic data for use in the Shoreham Cement Works project. These are from the National Highways A27 data collection programme in 2015 and from the Shoreham Free Wharf Transport Assessment in 2017.

6.1.4 Data from the following manual traffic surveys have been derived for the junctions assessed:

<u>Highways England A27 Data Collection Programme 2015 (Tuesday 23rd June 2015)</u>

- A283 / A27 Slips Roundabout;
- A283 / A259 Roundabout;
- A27 / Old Shoreham Road
- A27 / Coombes Road
- A27 / A2025 / Manor Road (Lancing Manor) Roundabout

<u>Shoreham Free Wharf Transport Assessment (2017)</u>

- A283 / Upper Shoreham Road Roundabout;

<u>Horsham Study Data (Thursday 23rd May 2019)</u>

- A283 / A24 (Washington) Roundabout;
- A283 / Water Lane / Chanctonbury Ring Road Crossroads;
- A283 / Maudlin Lane / Clays Hill / Castle Lane / The Street Roundabout;
- A283 / A2037 Roundabout;

6.1.5 In the absence of observed flows for the A283 / B2135 Horsham Road staggered junction, WSCC provided modelled flows for 2019. As discussed in Section 2.5, the straight-ahead movements were found to be significantly lower than the 2019 observed flows at the Clays Hill Roundabout and Water Lane crossroad.

6.1.6 As such, to be robust it was agreed with WSCC to use the straight ahead flows on the A283 from the neighbouring junctions but maintain the turning movements to/from B2135 and Horsham Road.

6.1.7 The observed traffic flows are shown diagrammatically as Appendix 6.1 and 6.2 for the AM and PM peak hours, respectively.

6.2 Baseline Year 2033 – Growth Factors

6.2.1 The observed traffic flows have been upscaled to year 2033, this is the year of assessment as agreed with WSCC and NH. The traffic surveys used and area specific TEMPro growth factors have been outlined in TN2.

6.2.2 Planning Policy Manager Mr T Moody of Adur & Worthing Councils provided a list of committed developments from 2018. In addition to these committed developments, Mr Moody also provided a list of allocated developments within emerging Worthing Local Plan.

6.2.3 The following Local Plan Allocation sites within Adur Local Plans were also noted:

- 1,100 dwellings allocated at Shoreham Harbour Regeneration Area: 1100 (minus the Free Wharf and Kingston Wharf consents);
- Land at West Sompting;
- New Monks Farm – as IKEA has announced that this store will not be delivered, the Council are seeking employment floorspace on the former IKEA land (Consistent with the Adur Local Plan 2017 Policy 5);
- AWDM/2139/20 Pilot Pub – Consent granted on 6th April 2021 for 34 dwellings.

6.2.4 A list of all committed developments and Local Plan Allocations is provided in Appendix 6.3.

6.2.5 The proposed methodology that has been accepted by WSCC and NH is to represent committed developments and Local Plan allocations within overall growth for small to medium sites and to those that lie outside the immediate study area (i.e., beyond the area where the junction impacts are considered).

6.2.6 Therefore, except for New Monks Farm development and Shoreham Airport development, other sites will be represented within overall growth. New Monks Farm and Shoreham Airport development flows have been added manually and hence these developments are not listed in Appendix 6.3.

6.2.7 The number of dwellings and jobs (based on Employment Densities 3rd Edition) that would be generated as a result of the committed developments and Local Plan allocations (bar New Monks Farm and Shoreham Airport developments) is also provided in Appendix 6.3.

6.2.8 Based on this, there will be a total of 1,753 homes and 592 jobs created within Adur and 2,330 homes and 3,174 jobs created within Worthing as a result of all the committed developments and Local Plan allocations (excluding New Monks Farm and Shoreham Airport development).

6.2.9 Adding the aforementioned homes and jobs to the 2018 baseline number of homes and jobs in TEMPRO would provide 2033 baseline number of homes and jobs (bar New Monks Farm and Shoreham Airport developments). **[Note: The year 2018 has been used because the developments considered have been granted planning permissions since 2018].**

6.2.10 The TEMPRO adjusted assumptions for the year 2033 based on the above methodology are provided in Table 6A.

Table 6A 2033 TEMPRO Adjusted Assumption

District	Use	Year 2033
Adur DC	Homes	30,665
	Jobs	27,051
Worthing DC	Homes	52,179
	Jobs	62,432

6.2.11 These 2033 TEMPRO adjusted assumptions were agreed with NH on 30th September 2021. They have been applied to obtain growth factors for:

- 2015-2033 (for surveys along A27 which were undertaken in 2015); and
- 2017-2033 (for surveys at A283/Upper Shoreham Road roundabout which were undertaken in 2017).

6.2.12 Based on the above, the TEMPRO growth factors that would be used are provided in Table 6B.

Table 6B TEMPRO Growth Factors

Area	Period	Trunk Road	All roads
Adur DC (2015-2033)	AM	1.1600 (urban)	1.1534 (urban)
	PM	1.1574 (urban)	1.1508 (urban)
Adur DC (2017-2033)	AM	1.1352 (urban)	1.1294 (urban)
	PM	1.1315 (urban)	1.1257 (urban)
Worthing DC (2015-2033)	AM	1.1808 (urban)	1.1741 (urban)
	PM	1.1777 (urban)	1.1710 (urban)

6.2.13 With regard to Horsham DC, traffic surveys were carried out in 2019. The increase in the number of households from 2019 to 2033 equates to 10,789. The TEMPRO growth factors (2019 to 2033) for Horsham DC are obtained as 1.1620 (AM) and 1.1647 (PM). These TEMPRO growth factors are considered to be reasonably robust as they are likely to include all commitments within this district.

6.2.14 The 2033 Traffic Flows (Without Major Committed Development) are shown diagrammatically as Appendices 6.4 and 6.5 for AM and PM peak hours, respectively.

6.3 Major Committed Development – New Monks Farm and Shoreham Airport

6.3.1 As mentioned previously, there are two major committed developments in the vicinity of the site:

- New Monks Farm (planning ref. AWDM/0961/17); and
- Shoreham Airport (planning ref. AWDM/1093/17)

6.3.2 These developments were supported by a Joint Transport Assessment prepared by Vectos in May 2017.

New Monks Farm Trips

Residential

6.3.3 The New Monks Farm development comprises 600 dwellings. The associated vehicle trips were distributed across the road network in the Joint TA as per Census 2011 O-D data – see Figure 8. The New Monks Farm residential development traffic flows are shown diagrammatically as Appendices 6.6 and 6.7 for AM and PM peak hours, respectively.

Employment

6.3.4 The New Monks Farm development also comprises consented IKEA, however IKEA have since decided not to build a store in this location.

6.3.5 Therefore, to determine what vehicle trips to represent this element of the New Monks Farm development, ADL met with Moira Hayes, Adur Planning Policy Manager. It was agreed that IKEA trips are the consented trips and therefore these should be tested. With regard to alternative employment use on IKEA land, Moira advised that ADL should use the employment assumptions that were tested within Local Plan modelling. For this, Moira directed us to the Second Addendum Revised Reissue September 2016.

6.3.6 Based on that email, for the purpose of Shoreham Cement Works transport study, ADL have used the employment breakdown for New Monks Farm as:

- B1 - 333 jobs
- B2 – 143 jobs
- B8 – 0 jobs

6.3.7 It is noted that Tables 2.7 and 2.8 of Second Addendum Revised Reissue September 2016 provide trip generation for New Monks Farm site. However, this trip generation includes both 600 homes and the employment use all in one. Subtracting residential trips based on trip rates for residential element (provided in Table 2.6), we were able to separate out the employment trip generation as follows:

- AM peak hour: IN = 132 OUT = 14
- PM peak hour: IN = 9 OUT = 107

6.3.8 As can be seen, the employment trips in the AM peak are significantly higher than IKEA trips and vice versa is true during PM peak. Hence, ADL have decided to go with the following for representing New Monks Farm's non-residential element for our SCW Transport Study project:

- AM peak hour: NMF employment trips i.e., 132 inbound and 14 outbound
- PM peak hour: IKEA trips i.e., 171 inbound and 180 outbound (taken from Vectos' Joint TA)
  [National Highways accepted this approach on 27th October 2021]

6.3.9 The New Monks Farm non-residential traffic flows are shown diagrammatically as Appendix 6.8 (i.e., NMF employment trips) for the AM peak hour, and Appendix 6.9 (IKEA trips).

Shoreham Airport Trips

6.3.10 The Shoreham Airport employment trips were also distributed based on Census 2011 O-D data – see Figure 16 of Vectos Joint TA. The Shoreham Airport traffic flows are shown diagrammatically as Appendices 6.10 and 6.11 for AM and PM peak hours, respectively.

Total Committed Development Trips

6.3.11 The Total Committed Development trips therefore comprise the following traffic flows:

- AM Peak Hour: New Monks Farm Residential + New Monks Farm Employment + Shoreham Airport
- PM Peak Hour: New Monks Farm Residential + IKEA + Shoreham Airport

6.3.12 The Total Committed Development traffic flows are shown diagrammatically as Appendices 6.12 and 6.13 for AM and PM peak hours, respectively.

2033 Baseline Trips

6.3.13 The 2033 (Without Major Committed Development) Traffic Flows plus Total Committed Development Traffic Flows therefore result in the 2033 Baseline Traffic Flows. The 2033 Baseline Traffic Flows are shown diagrammatically as Appendices 6.14 and 6.15 for AM and PM peak hours, respectively.

6.3.14 It should be noted that the 2033 Baseline Traffic Flows include the Permitted Development Traffic Flows.

6.4 Speed Survey Data on A283

6.4.1 ADL commissioned Auto Surveys Ltd to undertake two ATC (Automated Traffic Count) surveys on the A283, between Friday 16th July 2021 and Thursday 22nd July 2021, adjacent to both site access:

- ATC 1: approximately 50 metres north of northern access
- ATC 2: approximately 50 metres south of southern site access

6.4.2 This speed survey data for ATC 1 and ATC 2 is provided in Appendix 7.1 and Appendix 7.2, respectively. The average and 85th percentile speeds are summarised in Table 6C.

Table 6C A283 Speed Summary

		Average	85th Percentile	%HGV
ATC 1	Northbound	46.4 mph	53.4 mph	2.2 %
	Southbound	44.0 mph	50.1 mph	2.1 %
ATC 2	Northbound	48.6 mph	55.2 mph	2.3 %
	Southbound	47.4 mph	54.5 mph	2.2 %

* HGV = heavy goods vehicle

6.4.3 The recorded speeds on A283 have been used to inform the required visibility splays at any proposed site access.

6.4.4 The results of the speed survey should be treated with caution because the traffic levels in July 2021 were lower than pre-Covid on a typical day. Hence, junction speed surveys would need to be undertaken at planning application stage to ensure the visibility splay calculations are robust.

7.0 EXISTING ACCESSIBILITY BY NON-CAR MODES OF TRANSPORT

7.1 Walking

7.1.1 The site is located in a rural setting, with the nearest town to the north being Steyning, and the nearest town to the south being Shoreham-By-Sea, both approximately four kilometres from the site. However, the site does benefit from some existing pedestrian infrastructure, and the public rights of way within the vicinity of the site are very good.

Pedestrian Infrastructure

7.1.2 There is a footway on the southbound side of the A283, north of the northern site access. This is approximately two metres wide adjacent to the site and narrows to approximately one metre up to Dacre Gardens (a village comprising approximately 30 dwellings, fronting the eastern side of A283). There are no footways on the northbound side of the A283, nor south of the northern access.

7.1.3 The two portions of the site are connected by an underpass beneath the A283. The carriageway width at this point is approximately 5.6 metres wide (this includes 1.4-metre-wide footway). The headroom height of the tunnel is approximately 4.4 metres high, and the length of the tunnel is approximately 25 metres.

Public Rights of Way

7.1.4 The site benefits from several public rights of way (PROW) in the vicinity of the site, including footpaths bridleways and by-ways.

7.1.5 There is a footpath on both sides of the River Adur. Footpath number 3139 runs along the east side of the river and footpath number 2049 runs along the western side of the river.

7.1.6 The nearest crossing point across the River Adur is the footbridge approximately 650 metres north of the site. This is where path number 3209 intersects the two above mentioned footpaths. At this point, the South Downs Way traverses the River Adur, and then the A283.

7.1.7 The South Downs Way is a 100-mile/160-kilometre-long national trail which follows the old routes and droveways along the chalk escarpment and ridges of the South Downs. The South Downs Way crosses the A283 approximately 800 metres north of the site. The accesses on either side of the carriageway are staggered, approximately 90 metres distance. Here, there is an approximately two-metre footway on the eastern side of the carriageway, but no formal crossing facility from the western side of the carriageway to this footway. There have been no collisions involving pedestrians or cyclists recorded at this location and as such, there are no known highway safety issues that need to be addressed. However, as is described in Section 11.4, there is an opportunity to improve the crossing facility at this location.

7.1.8 A plan of the existing pedestrian infrastructure and the PROW network is provided as Appendix 8.1.

7.1.9 As described in Section 11.0 of this report, it is proposed to provide a link between the site and the public right of way along the River Adur, via the western portion of the site. It is also proposed to improve the pedestrian (and cycle/horse rider) crossing where the South Downs Way crosses the A283, approximately 800 metres north of the site.

7.2 Cycling

National Cycle Network

7.2.1 The site is well served by the National Cycle Network (NCN), which is a network of signed on-road and off-line cycle links. NCN Route 223 is known as the “Downs Link” from Chertsey to Shoreham-by-Sea, which runs along the east of the River Adur, adjacent to the site.

7.2.2 NCN 223 is traffic free between Shoreham (at the A283/A259 roundabout) up to the A283/Clays Hill roundabout to the south of Steyning. North of this point, there is a segment of on-road cycle route through Bamber, before returning to predominantly traffic-free routeing towards Henfield.

7.2.3 The provision of the NCN Route 223 adjacent to the site facilitates travel to/from the site by bicycle, between the site and Shoreham to the south and Steyning/Bamber/Upper Beeding to the north.

7.2.4 NCN Route 223 crosses the A283 approximately 900 metres northwest of the A283/A2037 roundabout. As is described in Section 11.4, this crossing point could be improved (for all users) by way of maintaining visibility in both directions and signage warning drivers of the crossing point for walkers, cyclists and horse riders.

Cycling Distance

7.2.5 According to the Department for Transport Cycle Infrastructure Design Local Transport Note (1/20), eight kilometres is considered a suitable distance to cycle for local journeys. This extent is shown on a plan provided as Appendix 8.2. This also shows the NCN within the vicinity of the site.

7.2.6 As mentioned previously, it is also proposed to improve the crossing where the South Downs Way crosses the A283, approximately 800 metres north of the site.

7.3 Public Transport

Bus

7.3.1 There are two bus stops on the A283 adjacent to the site's northern access. Both bus stops are equipped with bus flagpoles and timetable information.

7.3.2 The southbound bus stop is approximately 60 metres north of the northern access. The northbound bus stop is located opposite the northern site access.

7.3.3 These stops are therefore within the recommended maximum walking distance as per CIHT's *Buses in Urban Development* report (2018).

7.3.4 A plan showing the existing bus stop locations is provided as Appendix 8.3. Table 7A summarises the bus services at these bus stops.

Table 7A Bus Services Summary

Service №	Route	Frequency		
		Mon-Fri	Sat	Sun
2	Rottingdean to Steyning via Woodingdean, Race Hill, City Centre, Hove, Portslade, Southlands Hospital, Shoreham, Bramber	1 / hr	1 / hr	1 / hr
2B	Hove to Steyning via Portslade	2 / day	2 / day	1 / day
60	Old Steine to Steyning via Hove, Portslade, Manor Hall Road, Southwick, Shoreham, Bramber	1 / day	-	-
106	Henfield - Upper Beeding - Steyning - Lancing – Worthing (Tuesday / Wednesday / Friday)	1 / day	-	-
740	Lancing - Sompting – Steyning (school service)	1 / day	-	-

Source: https://www.buses.co.uk/, https://www.compass-travel.co.uk/ (as of 26/01/2022)

7.3.5 Table 3A demonstrates that the bus stops on the A283, adjacent to the site, serve five bus routes (includes one school service) which link the site with Shoreham, Worthing, Lancing and Hove to the south, and Steyning and Bamber to the north. Bus Route 2 provides an hourly service between Rottingdean and Steyning.

7.3.6 As described in Section 11.4 of this report, it is proposed to increase the frequency of Bus Route 2, and provide bus infrastructure within the site, and on A283, which would include bus shelter, seating, and real time information. This would improve the connectivity of the site to Steyning and Shoreham.

Rail

7.3.7 The nearest railway station to the site is Shoreham-by-Sea which is approximately five kilometres south of the site. This is equivalent to 15-minute cycle, or 55-minute walk.

7.3.8 Bus Route 2 also stops at this station, which takes 19 minutes from Shoreham Cement Works. Increased bus frequency of this route would make rail travel from this station more accessible and convenient for residents/staff/visitors of the site.

7.3.9 This station is served by Southern and provides rail links to Littlehampton, Portsmouth & Southsea and Southampton to the west; Brighton to the east; and London Victoria to the north.

7.3.10 The station is equipped with 131 car parking spaces and 42 cycle parking spaces. The station is Category B1 station, i.e., step free access to platforms via separate entrances.

8.0 PROPOSED DEVELOPMENT SCENARIOS

8.1 There are four development scenarios for the Shoreham Cement Works Area Action Plan which have been drawn up by SDNPA. All four have been assessed as part of this transport study.

8.2 Each of the four proposed development scenarios comprises a mix of land uses, across both sides of the A283. These scenarios, and their respective schedule of development, are summarised in Table 8A.

Table 8A Development Scenarios

Current Use Class	Former Use Class	1	2	3	4
		Housing / Employment Led	Housing / Employment Led	Leisure Led	Appeal scheme
B2: General industrial	B2	16,200	16,200	0	13,250
B8: Storage or distribution	B8	20,000	20,000	0	13,250
C1: Hotel*	C1	7,500	7,500	7,500	7,500
E(a): Retail	A1	0	0	500	0
E(b): Consumption of food & drink on premises	A3	0	0	1,500	1,500
E(d): Indoor sport, recreation & fitness**	D2	0	0	18,500	0
E(g)(i): Offices	B1(a)	0	0	0	12,000
E(g)(ii): Research & Development / E(g)(iii) Industrial processes	B1 (b/c)	32,000	32,000	32,000	0
F1: Learning & non-residential institution	D1	2,000	2,000	10,000	0
F2(a): Local shop	A1	280	280	280	0
C3: Dwellings	C3	400	240	200	84
Total commercial floorspace		**77,980**	**77,980**	**70,280**	**47,500**
Total homes		**400**	**240**	**200**	**84**

*Possibility of sui generis for hostel
**Possibility of sui generis for live music venue

Notes:
Floorspace of hotel kept constant at 7,500 m2. This is approx equivalent to a 130-bed hotel based on the TRICS database
Floorspace of a local shop kept constant in first 3 scenarios. Floorspace of 280 m2 is the maximum allowed under this use class.
The employment floorspace figure for the appeal scheme has been split equally between B2 and B8
The E(b): Consumption of food & drink on premises in scenario 3 is a pub/restaurant but is not sui generis drinking establishment

8.3 The western portion of the site is allocated for residential use only.

9.0 PROPOSED TRIP GENERATION

9.1 Traffic Impact Assessment Methodology

9.1.1 The trip generation associated with each element of the four scenarios has been calculated using TRICS database.

9.1.2 As stated within Adur Local Plan Transport Assessment, Horsham Transport Study and Shoreham Harbour Transport Study, the experience from the Sustainable Travel Towns (Worcester, Peterborough, and Darlington) as per the DfT document *The Effects of Smarter Choices Programmes in Sustainable Travel Towns; Research Report* (2010) saw a reduction of 9% in car driver trips in 2008 compared to 2004.

9.1.3 However this initial reduction was not necessarily maintained in full over time. DfT's 2016 document *Sustainable Travel Towns: An Evaluation of The Longer Term Impacts* which provides evaluation conducted by Transport Research Laboratory (TRL) on behalf of DfT of the impact of the Sustainable Travel Towns project states that the overall there was a reduction in total traffic levels in the order of 2%.

9.1.4 The reasons that the initial reduction was not maintained was due to promotion activities being reduced or discontinued after initial project funding ceased or increase in public transport fares. Hence, reduction in car trips based on Sustainable Travel Towns report was not considered as suitable for use within this transport study.

9.1.5 Moreover, it should be noted that in Section 12.0 (proposed site access arrangement) and 13.0 (off-site junctions) of this report, the junction capacity assessments are based on typical commuter peak hours and during these periods, it is considered that the likelihood of walking (and to some extent, cycling) related improvements is unlikely to tip the balance from private cars to walking (and cycling) to any material extent. This is mainly due to the semi-rural nature of site's location and also due to sparsity of trip-attracting destinations in the vicinity of the site. Hence, applying a reduction to car trips without robust evidence to substantiate the reduction is not considered appropriate.

9.1.6 The trip generation has therefore been based on worst-case assumption whereby no restraint to car trips have been applied. This assumption has been used to calculate the 'true' cost of implementing physical improvements to the junctions that are severely impacted by the development proposals.

9.1.7 In the areas where a large number of development trips are concentrated and where the investment in buses, cycle routes and other sustainable initiatives can be seen as most effective, the aforementioned calculated true cost (to implement physical improvements to the junctions) have been set aside for sustainable initiatives instead (as discussed in Section 11.0); namely junctions in Shoreham-by-Sea.

9.1.8 In the areas such as Steyning and Pulborough, where the development trips travel through to get to the wide range of destinations further afield, and sustainable initiatives in these areas would not result in a material reduction in car traffic. Hence, the costs to implement physical improvements to the junctions based on the aforementioned worst-case assumption are in fact set aside to bring about these physical improvements. Similar approach has been taken for the roundabout junctions of the A27 slips with the A283 and A27 with Grinstead Lane due to the strategic nature of these junctions.

9.1.9 The trip rates outlined in this chapter have been agreed as per Technical Note 1, and ongoing discussion between ADL, WSCC and NH.

9.2 Proposed Trip Rates – TRICS Assessment

Residential (Use Class C3)

9.2.1 To represent the residential element of the proposed development scenarios (i.e., Scenario 1, 2, 3, and 4), the following parameters in the TRICS database were selected:

- Main land use: Residential
- Sub land use: Houses privately owned
- Regions: England (excl. London), Wales, Scotland
- № of dwellings: Between 60 and 600 units
- Location: Edge of town

- Other:
    - Multi-modal surveys
    - Sites with Travel Plan excluded
    - Sites which flats excluded (flats typically have lower car ownership)

9.2.2 The TRICS report is provided as Appendix 9.1. The trip rates and trip generation for each proposed development scenario are summarised in Table 9A.

Table 9A Proposed Trip Generation: Residential

Trip Rate				
	Peak Hour	**In**	**Out**	**Two-Way**
Per Dwelling	08:00-09:00	0.125	0.385	0.510
	17:00-18:00	0.342	0.135	0.477
Trip Generation				
Scenario	**Peak Hour**	**In**	**Out**	**Two-Way**
1	08:00-09:00	50	154	204
400 Dwellings	17:00-18:00	137	54	191
2	08:00-09:00	30	92	122
240 Dwellings	17:00-18:00	82	32	114
3	08:00-09:00	25	77	102
200 Dwellings	17:00-18:00	68	27	95
4	08:00-09:00	11	32	43
84 Dwellings	17:00-18:00	29	11	40

**Trip rates agreed as per Technical Note 1*

9.2.3 Table 9A demonstrates that the residential element of the proposed development scenarios would generate the following two-way vehicle movements in the AM and PM peak hours:

- Scenario 1: AM = 204 PM = 191
- Scenario 2: AM = 122 PM = 114
- Scenario 3: AM = 102 PM = 95
- Scenario 4: AM = 43 PM = 40

R&D/Light Industrial/Storage & Distribution (Use Classes B2, B8, E(g)(ii), E(g)(iii))

9.2.4 To represent the employment elements of the proposed development scenarios (i.e., Scenario 1, 2, 3, and 4), the following parameters in the TRICS database were selected:

- Main Land use: Employment
- Sub Land use: Industrial estate
- Regions: England (excl. London), Wales, Scotland
- Location: Edge of town

- Other:
    - Multi-modal surveys
    - Sites which do not contain any of the B1/B2/B8 excluded

9.2.5 The TRICS report is provided as Appendix 9.2. The trip rates and trip generation for each proposed development scenario are summarised in Table 9B.

Table 9B Proposed Trip Generation: Employment

Trip Rate				
	Peak Hour	**In**	**Out**	**Two-Way**
Per 100 sqm	08:00-09:00	0.317	0.121	0.438
	17:00-18:00	0.094	0.336	0.430
Trip Generation				
Scenario	**Peak Hour**	**In**	**Out**	**Two-Way**
1	08:00-09:00	216	83	299
68,200 sqm	17:00-18:00	64	229	293
2	08:00-09:00	216	83	299
68,200 sqm	17:00-18:00	64	229	293
3	08:00-09:00	101	39	140
32,000 sqm	17:00-18:00	30	108	138
4	08:00-09:00	84	32	116
36,500 sqm	17:00-18:00	25	89	114

**Trip rates agreed as per Technical Note 1*

9.2.6 Table 9B demonstrates that the employment elements of proposed development scenarios would generate the following two-way vehicle movements in the AM and PM peak hours:

- Scenario 1: AM = 299 PM = 293
- Scenario 2: AM = 299 PM = 293
- Scenario 3: AM = 140 PM = 138
- Scenario 4: AM = 116 PM = 114

Local Shop (Use Class F2(a))

9.2.7 To represent the local shop element of the proposed development scenarios (i.e., Scenario 1, 2, and 3), the following parameters in the TRICS database were selected:

- Main Land use: Retail
- Sub Land use: Convenience store
- Regions: England (excl. London), Wales, Scotland
- Location: Suburban (edge of town sites not available)

- Other:
    - Multi-modal surveys
    - Area between 100sqm and 300sqm (+/- 50% of proposed area)

9.2.8 The TRICS report is provided as Appendix 9.3. The trip rates and trip generation for each proposed development scenario are summarised in Table 9C.

Table 9C Proposed Trip Generation: Local Shop

Trip Rate				
	Peak Hour	**In**	**Out**	**Two-Way**
Per 100 sqm	08:00-09:00	11.148	10.983	22.131
	17:00-18:00	11.449	10.258	21.707
Trip Generation				
Scenario	**Peak Hour**	**In**	**Out**	**Two-Way**
1, 2, and 3 280 sqm	08:00-09:00	31	31	62
	17:00-18:00	32	29	61

**Trip rates agreed as per Technical Note 1*

9.2.9 Table 9C demonstrates that the local shop element of proposed development scenarios would generate the following two-way vehicle movements in the AM and PM peak hours:

- Scenario 1, 2 and 3: AM = 62 PM = 61

Hotel (Use Class C1)

9.2.10 To represent the hotel element of the proposed development scenarios (i.e., Scenario 1, 2, 3, and 4), the following parameters in the TRICS database were selected:

- Main Land use: Hotel, Food and Drink
- Sub Land use: Hotels
- Regions: England (excl. London), Wales, Scotland
- Location: Edge of town
- Other:
    - Multi-modal surveys

9.2.11 The TRICS report is provided as Appendix 9.4. The trip rates and trip generation for each proposed development scenario are summarised in Table 9D.

Table 9D Proposed Trip Generation: Hotel

Trip Rate				
	Peak Hour	**In**	**Out**	**Two-Way**
Per 100 sqm	08:00-09:00	0.383	0.509	0.892
	17:00-18:00	0.350	0.304	0.654
Trip Generation				
Scenario	**Peak Hour**	**In**	**Out**	**Two-Way**
1, 2, 3 and 4 7,500 sqm	08:00-09:00	29	38	67
	17:00-18:00	26	23	49

**Trip rates agreed as per Technical Note 1*

9.2.12 Table 9D demonstrates that the hotel element of proposed development scenarios would generate the following two-way vehicle movements in the AM and PM peak hours:

- Scenario 1, 2, 3 and 4: AM = 67 PM = 49

Offices (Use Class E(g)(i))

9.2.13 To represent the offices element of the proposed development scenarios (i.e., Scenario 4), the following parameters in the TRICS database were selected:

- Main Land use: Employment
- Sub Land use: Business Park
- Regions: England (excl. London), Wales, Scotland
- Location: Edge of town
- Other:
  - Multi-modal surveys

9.2.14 The TRICS report is provided as Appendix 9.5. The trip rates and trip generation for each proposed development scenario are summarised in Table 9E.

Table 9E Proposed Trip Generation: Offices

Trip Rate				
	Peak Hour	**In**	**Out**	**Two-Way**
Per 100 sqm	08:00-09:00	1.182	0.138	1.320
	17:00-18:00	0.079	0.843	0.922
Trip Generation				
Scenario	**Peak Hour**	**In**	**Out**	**Two-Way**
4 12,000 sqm	08:00-09:00	142	17	159
	17:00-18:00	9	101	110

9.2.15 Table 9E demonstrates that the offices element of proposed development scenarios would generate the following two-way vehicle movements in the AM and PM peak hours:

- Scenario 4: AM = 159 PM = 110

Consumption of Food & Drink on Premises (Use Class E(b))

9.2.16 To represent the pub/restaurant element of the proposed development scenarios (i.e., Scenario 3 and 4), the following parameters in the TRICS database were selected, as per WSCC's suggestions via email on 27th October 2021:

- Main Land use: Hotel, Food and Drink
- Sub Land use: Pub/Restaurant
- Regions: England (excl. London), Wales, Scotland
- Location: Edge of town

9.2.17 The TRICS report is provided as Appendix 9.6. The trip rates and trip generation for each proposed development scenario agreed with WSCC are summarised in Table 9F.

Table 9F Proposed Trip Generation: Pub/Restaurant

Trip Rate				
	Peak Hour	**In**	**Out**	**Two-Way**
Per 100 sqm	08:00-09:00	0.000	0.000	0.000
	17:00-18:00	4.987	3.003	7.990
Trip Generation				
Scenario	**Peak Hour**	**In**	**Out**	**Two-Way**
3 and 4	08:00-09:00	0	0	0
1,500 sqm	17:00-18:00	75	45	120

**Trip rates agreed via email with WSCC on 27/10/2021*

9.2.18 Table 9F demonstrates that the pub/restaurant element of proposed development scenarios would generate the following two-way vehicle movements in the AM and PM peak hours:

- Scenario 3 and 4: AM = 0 PM = 120

Learning & Non-Residential Institution (Use Class F2(a))

9.2.19 To represent the learning/non-residential institution element of the proposed development scenarios (i.e., Scenarios 1, 2, and 3), it was agreed with SDNPA and WSCC on 27th October 2021 that this use would be treated as museums/art galleries/exhibition centres. The following parameters in the TRICS database were selected:

- Main Land use: Leisure
- Sub Land use: Art Galleries / Museums / Exhibitions
- Regions: England (excl. London), Wales, Scotland
- Location: Edge of town

9.2.20 The TRICS report is provided as Appendix 9.7. The trip rates and trip generation for each proposed development scenario are summarised in Table 9G.

Table 9G Proposed Trip Generation: Art Galleries/Museums/Exhibitions

Trip Rate				
	Peak Hour	**In**	**Out**	**Two-Way**
Per 100 sqm	08:00-09:00	0.000	0.000	0.000
	17:00-18:00	0.038	0.385	0.423
Trip Generation				
Scenario	**Peak Hour**	**In**	**Out**	**Two-Way**
1	08:00-09:00	0	0	0
2,000 sqm	17:00-18:00	1	8	9
2	08:00-09:00	0	0	0
2,000 sqm	17:00-18:00	1	8	9
3	08:00-09:00	0	0	0
10,000 sqm	17:00-18:00	4	39	43

**Trip rates agreed via email with WSCC on 26/10/2021*

9.2.21 Table 9G demonstrates that the employment elements of proposed development scenarios would generate the following two-way vehicle movements in the AM and PM peak hours:

- Scenario 1: AM = 0 PM = 9
- Scenario 2: AM = 0 PM = 9
- Scenario 3: AM = 0 PM = 43

9.3 Proposed Trip Rates – Leisure Use, Scenario 3

9.3.1 With regard to the proposed leisure trip generation use in Scenario 3, ADL derived annual visitor trips from four Zip World sites in Wales.

9.3.2 There are four Zip World sites in Wales (Fforest in Betws-y-Coed, Penrhyn Quarry in Bethesda, Slate Caverns in Blaenau Ffestiniog and Tower in Aberdare). In 2019, the number of visitors to all four Zip World sites was 400,00 per year; given each site has differing number of adventure activities, it is assumed that the site with most adventures (Fforest with six) could attract 150,00 visitors per year.

9.3.3 For the purpose of trip generation, ADL have made the following assumptions:

- Average car occupancy = 3 visitors per car
- Average coach occupancy = 50 visitors per coach
- 80% visitors arrive by car and 20% visitors arrive by coach
- For robust assessment, 30-week activity period (Zip World is open for longer than this).

9.3.4 Based on the above assumptions, the following is calculated:

- 120,000 visitors in cars OR 40,000 cars per year OR 1,333 cars per week 190 cars per day;
- 30,000 visitors in coaches per year OR 600 coaches per year OR 20 coaches per week OR three coaches per day.

9.3.5 In order to gauge the arrival and departure profile for a weekday, ADL and WSCC agreed to use profile from leisure centre sites in TRICS. As explained in Section 2.4, the assumptions were made because the pattern of use in terms of times of day and length of stay may be reasonably similar, albeit there is still significant evening use, but more representative in the evening than the leisure park.

9.3.6 Given that the intensity of daily and peak use is similar between both uses, the trip distribution based on leisure centre sites is likely to produce a robust PM peak assessment.

9.3.7 This TRICS output is provided as Appendix 9.8. The arrival/departure profile and trip generation for each proposed development scenario are summarised in Table 9H.

Table 9H Proposed Trip Generation: Leisure Use

Arrival / Departure Profile			
	Peak Hour	**Arrival**	**Departure**
Trip %	08:00-09:00	4.7%	3.6%
	17:00-18:00	15.8%	13.0%

Trip Generation				
Scenario	**Peak Hour**	**In**	**Out**	**Two-Way**
3	08:00-09:00	9	7	16
18,500 sqm	17:00-18:00	30	25	55

**Arrival/departure profile agreed via email with WSCC on 01/10/2021*

9.3.8 Table 9H demonstrates that the leisure use element of proposed development scenarios would generate the following two-way vehicle movements in the AM and PM peak hours:

- Scenario 3: AM = 16 PM = 55

9.4 Trip Internalisation

Residential and Employment

9.4.1 Although it is likely that the mix of residential use and employment use in the proposed development scenarios would result in internal trips being made (i.e., residents would also be employed on site and therefore would not need to travel by car), this is considered to be limited because of relatively small-scale residential element. However, no internalisation of employment trips has been accounted for within the traffic impact assessment exercise. The proposed trip generation is therefore considered to be robust.

Local Shop

9.4.2 The proposed convenience store would be a local facility predominantly used by the residents and staff living and working within the development. During peak hours, there is unlikely to be any external trips or servicing trips that would be generated by this convenience store. This is agreed with SDNPA and WSCC at the meeting on 5th August 2021.

Consumption of Food & Drink on Premises

9.4.3 It is considered that this Use Class provides a complimentary facility to the proposed hotel + leisure + F1 + dwellings (in case of Scenario 3) and employment uses + hotel + dwellings (in case of Scenario 4).

9.4.4 Given the (more or less) remote location of the site in terms of its proximity to the nearest conurbations, it is unlikely that there will be people from further afield travelling to the site to visit this Use Class i.e., the proposed public house / restaurant would not be point of destination.

9.4.5 It was agreed with WSCC that, for the purposes of robust assessment, 70% of the trips to this Use Class would be internal trips and the remaining 30% would be external, i.e., those passing by along the A283. Therefore, the new two-way vehicle movements in the AM and PM peak hours would be:

- Scenario 3 and 4: AM = 0 PM = 37 (23 IN + 14 OUT)

9.5 Total Proposed Trip Generation

9.5.1 Based on the trip rates outline in Section 9.1 and 9.2, and factoring the internalisation of trip from Section 9.3, the total trip generation can be calculated for each of the Proposed Development Scenarios.

Scenario 1

9.5.2 The total proposed trip generation for Scenario 1 is summarised in Table 9I.

Table 9I Proposed Trip Generation: Scenario 1

Use	Peak Hour	In	Out	Two-Way
Residential	08:00 – 09:00	50	154	204
	17:00 – 18:00	137	54	191
Employment	08:00 – 09:00	216	83	299
	17:00 – 18:00	64	229	293
Hotel	08:00 – 09:00	29	38	67
	17:00 – 18:00	26	23	49
Learning/Non-Residential Institution	08:00 – 09:00	0	0	0
	17:00 – 18:00	1	8	9
Total	**08:00 – 09:00**	**295**	**275**	**570**
	17:00 – 18:00	**228**	**314**	**542**

9.5.3 Table 9I demonstrates that Scenario 1 would generate 570 and 542 two-way vehicle trips during the AM and PM peak hours, respectively. Given that car trips are not restrained (either by way of sustainable initiatives or taking into account internalisation trips and increase in working from home pattern), these trips reflect a worst-case scenario.

Scenario 2

9.5.4 The total proposed trip generation for Scenario 2 is summarised in Table 9J.

Table 9J Proposed Trip Generation: Scenario 2

Use	Peak Hour	In	Out	Two-Way
Residential	08:00 – 09:00	30	92	122
	17:00 – 18:00	82	32	114
Employment	08:00 – 09:00	216	83	299
	17:00 – 18:00	64	229	293
Hotel	08:00 – 09:00	29	38	67
	17:00 – 18:00	26	23	49
Learning/Non-Residential Institution	08:00 – 09:00	0	0	0
	17:00 – 18:00	1	8	9
Total	**08:00 – 09:00**	**275**	**213**	**488**
	17:00 – 18:00	**173**	**292**	**465**

9.5.5 Table 9J demonstrates that Scenario 2 would generate 488 and 465 two-way vehicle trips during the AM and PM peak hours, respectively. Given that car trips are not restrained (either by way of sustainable initiatives or taking into account internalisation trips and increase in working from home pattern), these trips reflect a worst-case scenario.

Scenario 3

9.5.6 The total proposed trip generation for Scenario 3 is summarised in Table 9K.

Table 9K Proposed Trip Generation: Scenario 3

Use	Peak Hour	In	Out	Two-Way
Residential	08:00 – 09:00	25	77	102
	17:00 – 18:00	68	27	95
Employment	08:00 – 09:00	101	39	140
	17:00 – 18:00	30	108	138
Hotel	08:00 – 09:00	29	38	67
	17:00 – 18:00	26	23	49
Learning/Non-Residential Institution	08:00 – 09:00	0	0	0
	17:00 – 18:00	4	39	43
Pub/Restaurant	08:00 – 09:00	0	0	0
	17:00 – 18:00	23	14	37
Leisure Use	08:00 – 09:00	9	7	16
	17:00 – 18:00	30	25	55
Total	**08:00 – 09:00**	**164**	**161**	**325**
	17:00 – 18:00	**181**	**236**	**417**

9.5.7 Table 9K demonstrates that Scenario 3 would generate 325 and 417 two-way vehicle trips during the AM and PM peak hours, respectively. Given that car trips are not restrained (either by way of sustainable initiatives or taking into account internalisation trips and increase in working from home pattern), these trips reflect a worst-case scenario.

Scenario 4

9.5.8 The total proposed trip generation for Scenario 4 is summarised in Table 9L.

Table 9L Proposed Trip Generation: Scenario 4

Use	Peak Hour	In	Out	Two-Way
Residential	08:00 – 09:00	11	32	43
	17:00 – 18:00	29	11	40
Employment	08:00 – 09:00	84	32	116
	17:00 – 18:00	25	89	114
Hotel	08:00 – 09:00	29	38	67
	17:00 – 18:00	26	23	49
Offices	08:00 – 09:00	142	17	159
	17:00 – 18:00	9	101	110
Pub/Restaurant	08:00 – 09:00	0	0	0
	17:00 – 18:00	23	14	37
Total	**08:00 – 09:00**	**266**	**119**	**385**
	17:00 – 18:00	**112**	**238**	**350**

9.5.9 Table 9L demonstrates that Scenario 4 would generate 385 and 350 two-way vehicle trips during the AM and PM peak hours, respectively. Given that car trips are not restrained (either by way of sustainable initiatives or taking into account internalisation trips and increase in working from home pattern), these trips reflect a worst-case scenario.

10.0 TRIP DISTRIBUTION

10.1 Methodology

10.1.1 The proposed vehicular trip generation from each of the proposed development scenarios have been distributed across the transport study area.

10.1.2 Different elements of proposed development scenarios have been distributed differently. The methodology has been agreed as per TN1 and through further discussion with WSCC and NH.

Residential and Employment Trips

10.1.3 ADL reviewed the Joint Transport Assessment prepared in support of New Monks Farm and Shoreham Airport developments by Vectos. Here, both residential and employment trips were distributed using Census 2011 Origin-Destination (O-D) dataset – *WU03EW - Location of usual residence and place of work by method of travel to work (MSOA level).* This approach was approved by the Highway Authority. All the residents and employment trips were assigned on to the local road network using web-based journey planning tools.

10.1.4 Following the meeting with SDNPA and WSCC on 5th August 2021, it was agreed that whilst the census is the best source for travel to work trips, the Mobile Network Data (MND) is the best source for distribution of other trip purposes.

10.1.5 The West Sussex Mobile Network Data Origin-Destination Matrix for 2015, as produced by Telefonica, was provided by WSCC on 30th July 2021. The data is separated into different modes (road, rail and HGV). The data is split by purpose into the following categories:

- Non-Home Based (NHB) Trips – trips starting and ending in other locations and/or workplaces
- Outbound Home-Based Work (OB_HBW) Trips – trips between a place of residence and a regular place of work
- Outbound Home Based Other (OB_HBO) Trips – trips starting from place of residence to other locations

- Inbound Home-Based Work (IB_HBW) Trips – trips between a regular place of work and a place of residence
- Inbound Home Based Other (IB_HBO) Trips – trips starting in other locations and to place of residence

10.1.6 Given that the strategic transport models were not considered to be appropriate for the use for this study, due to various deficiencies on the A27 within Worthing Model and Shoreham Harbour Model being based on 2009 data, trip assignment/routeing has been based upon Google Maps as agreed with SDNPA and WSCC.

10.1.7 Trip distribution has been based on the following Middle Super Output Areas with Census and MND:

- Residential: Horsham 016A to 016E MSOA
- Employment: Adur 007A MSOA

10.1.8 For residential trips, appropriate split for Census desired journey to work trips and MND desired home-based trips (HBO) would be used, as advised by WSCC. For employment trips, appropriate split for Census desired journey to work trips and MND desired other trips (NHB) would be used as advised by WSCC.

10.1.9 Based on the agreed trip distribution methodology, trip distribution split between Census and MND for residential and employment elements are provided in Table 10A and 10B.

Table 10A Residential Trip Distribution Split

	In		Out	
	Census HBW	**MND HBO**	**Census HBW**	**MND HBO**
AM Peak Hour	4%	96%	58%	42%
PM Peak Hour	52%	48%	0%	100%

Table 10B Employment Trip Distribution Split

	In		Out	
	Census HBW	**MND NHB**	**Census HBW**	**MND NHB**
AM Peak Hour	69%	31%	0%	100%
PM Peak Hour	3%	97%	53%	47%

Hotel, Learning/Non-residential Institution Leisure, and Pub/Restaurant Trips

10.1.10 For Hotel, Learning/Non-residential Institution, Leisure, and Pub/Restaurant trip distribution, MND desired NHB trips has been used.

10.2 Trip Distribution Assignment

10.2.1 The trip distribution for Census O-D (Residential) is shown diagrammatically for both AM and PM peak hours as Appendix 10.1.

10.2.2 The trip distribution for Census O-D (Employment) is shown diagrammatically for both AM and PM peak hours as Appendix 10.2.

10.2.3 The trip distribution for MND HBO for residential trips are shown diagrammatically as Appendices 10.3 and 10.4, for the AM and PM peak hours, respectively.

10.2.4 The trip distribution for MND NHB for employment trips are shown diagrammatically as Appendices 10.5 and 10.6, for the AM and PM peak hours, respectively.

10.2.5 The trip distribution for MND NHB for Hotel, Learning/Non-residential Institution Leisure, and Pub/Restaurant trips are shown diagrammatically as Appendices 10.7 and 10.8, for the AM and PM peak hours, respectively.

10.3 Proposed Trip Distribution

Residential

10.3.1 The proposed residential traffic flows for each proposed development scenario are shown diagrammatically as the following Appendices:

- Scenario 1 AM Peak Hour – Appendix 11.1
- Scenario 1 PM Peak Hour – Appendix 11.2
- Scenario 2 AM Peak Hour – Appendix 11.3
- Scenario 2 PM Peak Hour – Appendix 11.4
- Scenario 3 AM Peak Hour – Appendix 11.5
- Scenario 3 PM Peak Hour – Appendix 11.6

- Scenario 4 AM Peak Hour – Appendix 11.7
- Scenario 4 PM Peak Hour – Appendix 11.8

Employment

10.3.2 The proposed employment traffic flows for each proposed development scenario are shown diagrammatically as the following Appendices:

- Scenario 1 AM Peak Hour – Appendix 11.9
- Scenario 1 PM Peak Hour – Appendix 11.10
- Scenario 2 AM Peak Hour – Appendix 11.11
- Scenario 2 PM Peak Hour – Appendix 11.12
- Scenario 3 AM Peak Hour – Appendix 11.13
- Scenario 3 PM Peak Hour – Appendix 11.14
- Scenario 4 AM Peak Hour – Appendix 11.15
- Scenario 4 PM Peak Hour – Appendix 11.16

Hotel

10.3.3 The proposed hotel traffic flows for all proposed development scenario are shown diagrammatically as Appendices 11.17 and 11.18 for the AM and PM peak hours, respectively.

Offices

10.3.4 The proposed offices traffic flows for proposed development scenario 4 are shown diagrammatically as Appendices 11.19 and 11.20 for the AM and PM peak hours, respectively.

Pub/Restaurant

10.3.5 The proposed pub/restaurant traffic flows for proposed development scenario 3 and 4 are shown diagrammatically as Appendix 11.21 for the PM peak hour.

Learning/Non-residential Institution

10.3.6 The proposed Learning/Non-residential Institution traffic flows for each proposed development scenario are shown diagrammatically as the following Appendices:

- Scenario 1 PM Peak Hour – Appendix 11.22
- Scenario 2 PM Peak Hour – Appendix 11.23
- Scenario 3 PM Peak Hour – Appendix 11.24

Leisure Use

10.3.7 The proposed leisure use traffic flows for proposed development scenario 3 are shown diagrammatically as Appendices 11.25 and 11.26 for the AM and PM peak hours, respectively.

10.4 Proposed Trip Distribution – Total Scenario Flows

Total Proposed Scenario Flows

10.4.1 The proposed traffic flows for each proposed development scenario are shown diagrammatically as the following Appendices:

- Scenario 1 AM Peak Hour – Appendix 12.1
- Scenario 1 PM Peak Hour – Appendix 12.2
- Scenario 2 AM Peak Hour – Appendix 12.3
- Scenario 2 PM Peak Hour – Appendix 12.4
- Scenario 3 AM Peak Hour – Appendix 12.5
- Scenario 3 PM Peak Hour – Appendix 12.6
- Scenario 4 AM Peak Hour – Appendix 12.7
- Scenario 4 PM Peak Hour – Appendix 12.8

2033 Total Flows

10.4.2 The 2033 total traffic situation in each of the proposed development scenarios comprises the 2033 Baseline Traffic Flows (see para. 6.3.13) minus Permitted Development Traffic Flows (to account for the loss of the permitted uses) plus Proposed Development Scenario Traffic Flows.

10.4.3 As such, **2033 Total Flows** are as follows:

Scenario 1:

- 2033 Baseline Traffic Flows – Permitted Development Traffic Flows + Scenario 1 Proposed Development Traffic Flows

Scenario 2:

- 2033 Baseline Traffic Flows – Permitted Development Traffic Flows + Scenario 2 Proposed Development Traffic Flows

Scenario 3:

- 2033 Baseline Traffic Flows – Permitted Development Traffic Flows + Scenario 3 Proposed Development Traffic Flows

Scenario 4:

- 2033 Baseline Traffic Flows – Permitted Development Traffic Flows + Scenario 4 Proposed Development Traffic Flows

10.4.4 The 2033 Total Traffic Flows are shown diagrammatically as the following Appendices:

- Scenario 1 AM Peak Hour – Appendix 12.9
- Scenario 1 PM Peak Hour – Appendix 12.10
- Scenario 2 AM Peak Hour – Appendix 12.11
- Scenario 2 PM Peak Hour – Appendix 12.12
- Scenario 3 AM Peak Hour – Appendix 12.13
- Scenario 3 PM Peak Hour – Appendix 12.14
- Scenario 4 AM Peak Hour – Appendix 12.15
- Scenario 4 PM Peak Hour – Appendix 12.16

11.0 SUSTAINABLE TRANSPORT MITIGATION

11.1 Introduction

11.1.1 The aim of a sustainable transport mitigation is to promote and encourage more sustainable ways for people to travel and to reduce the need for trips to be made by the private car, which is preferred over increasing highway capacity. This will involve the following:

- Internalisation of trips
- Reduction the need to travel
- Hard measures
- Soft measures

11.1.2 Any developer putting forward for a planning application for development at Shoreham Cement Works would be expected to provide a range of hard and soft sustainable transport measures to improve the connectivity within the site, and from outside the site, by alternative transport modes, and reducing the need to travel by private car.

11.2 Trip Internalisation

11.2.1 The Horsham Transport Study (May 2021) uses 12% reduction in trips for sites where housing, jobs, schools, and other auxiliary uses are provided together. This internalisation rate is based on previous evidence gathered for the North Horsham development. The internalisation rate is also in line with that seen in TRICS for a mixed-use site located at Camborne to the west of Cambridge (noting that this is the only mixed-use site with data available within TRICS database).

11.2.2 With particular reference to residential trips, reducing the need to travel centres on both the benefit from auxiliary uses within the site (i.e., trip internalisation) as well as making fewer journeys, typically commuting journeys as a result of working from home.

11.2.3 The residential element within the development proposals which have been tested as part of the AAP are smaller in size than those within Cambourne and Cambridge and hence the propensity of trip internalisation between residential and employment uses is likely to be limited. Hence, this was not considered within the trip generation exercise. Nonetheless, given the development scenarios comprise mixed uses, they are considered to be conducive to generate some level of internalised trips as trips associated with the proposed local shop and public house has been internalised either partially or fully.

11.3 Reducing the Need to Travel

11.3.1 Along with the fact that the development scenarios benefit from auxiliary uses which would reduce the need to travel, the impact of the Covid-19 pandemic is likely to have lasting impacts in terms of flexible working patterns and remote working options from employers. This has reduced the need for residents to make external trips during network peak hours.

11.3.2 Fast broadband connection would be made available to all residents which enables working from home and therefore reducing the need to travel. Changing shopping patterns, i.e., increase online/deliveries is also reducing the likelihood of residents travelling for these purposes.

11.4 On and Off-Site Infrastructure (Hard Measures)

11.4.1 Hard measures are defined as physical infrastructure provided to encourage and facilitate sustainable travel. Hard measures for walking, cycling and public transport are discussed in the following paragraph.

Walking – On-site

11.4.2 The tunnel which links the two portions of the site, beneath the A283 would be improved in accordance with DfT's Local Transport Note 1/20 (LTN 1/20). This would include resurfacing and lighting. Appropriate mitigation measures in the form of automated bollards on either end of this tunnel would be installed to stop motor vehicles from using the tunnel, except for emergency vehicles.

Walking – Proposed Site Access Roundabout

11.4.3 Pedestrian ramps will be provided which would connect the tunnel to the footways on the proposed site access roundabout (see Section 12.2). These ramps would be no steeper than 1 in 20 gradient and subject to detailed design at a later stage of planning process.

11.4.4 The proposed site access roundabout will be provided with footways on all sides along with pedestrian crossing facility in the form of dropped kerbs, tactile paving, and splitter islands. This facility will provide safe access to the bus stops on the A283.

11.4.5 Any subsequent planning application and design of the site would ensure a footway network, both within the site, and externally to the existing footways and public rights of way within the vicinity of the site, would be integrated and ensure step-free access for those with reduced mobility.

Walking – Off-site

11.4.6 Funding for the installation of off-site interpretation boards, wooden mile marker posts and way markers for public rights of way in the vicinity of the site could be made available by utilising some of the off-site highway contribution costs calculated as per Section 14.9 of this report.

11.4.7 Where the South Downs Way crosses the A283, approximately 800 metres north of the site, the crossing facility from the western side of the carriageway to the footway on the eastern side of the carriageway could be improved by way of dropped kerbs and tactile paving. This would be of benefit to residents/staff/visitors of the site, but also leisure users not associated with Shoreham Cement Works.

Cycling – On-site

11.4.8 The development proposals would ensure there is appropriate cycle parking facilities to residents, staff, and visitors. Cycle stores would be covered and secure, and for employment uses would include the provision of lockers, showers and pump/repair stands (to facilitate longer journeys to/from work by cycle). There would be provision for large/adapted bikes as well as electric bikes.

11.4.9 Ramp access from the proposed site access roundabout would cater not only for pedestrians (as discussed above) but also cyclist to enter/exit the site from the A283. The ramps would adhere to maximum gradient and geometry as per LTN 1/20 and lead to the tunnel which connects the two portions of the site. The design of which would be dealt with at detailed design stage.

Linkage to Downs Link Path

11.4.10 At present there is no direct access into the site from the Downs Link path. It is proposed that an access is provided between the western portion of the site and the Downs Link path. This would be designed at per LTN 1/20, with appropriate gradient of the ramp to account for the levels difference between the site and the path.

National Cycle Route 223

11.4.11 Funding towards an upgrade of the surface of the National Cycle Network Route 223 (Downs Link), which runs alongside the site could also be made available by utilising some of the off-site highway contribution costs calculated as per Section 14.9 of this report. This could involve weatherproofing (i.e., upgraded surface material and drainage) to improve access all year round. This would be of benefit to walkers and horse riders too.

11.4.12 It is proposed that the NCN Route 223 crossing point across the A283 (approximately 2.2km northwest of the site) is improved by way of increasing the visibility in either direction on the A283, from both sides of the carriageway, and providing signage for motorists to indicate that a pedestrian/cyclist/horse rider crossing point is oncoming.

11.4.13 Improvements to the NCN Route 223 would improve the accessibility of the site for residents, as well as staff/visitors to the site. These improvements would also be of benefit to leisure users not associated with the site who are passing.

11.4.14 Through travel planning measures, all elements of the site would be equipped with appropriate cycle parking and facilities for staff and visitors of employment and leisure uses to shower and store cycle equipment.

Public Transport

11.4.15 As discussed in Section 7.3, out of four public bus services that serve the bus stop on the A283 adjacent to the site, Route 2 is the most frequent one. Funding towards increase in Route 2 service frequency from the current hourly service to twice hourly service could be done by way of:

- Extending one of the services between Shoreham High Street and Rottingdean AND/OR
- By an additional increase in number of bus services by one between Steyning-Shoreham-Brighton.

11.4.16 This would be subject to further discussions with the bus operator and site promoter and could be funded through the contributions which have been calculated for off-site junction improvements, as per Section 14.9 of this report. The subsequent planning application could look to liaise with a local bus operator to provide a service (or re-route) a service into SCW.

11.4.17 Bus stops on the A283 would be upgraded to be provided with shelter, seating, and real time information (RTIs). This would form part of S278/S106 contributions.

11.4.18 Similarly, should the development proposals in future provide on-site bus stops, these will also be provided with shelter, seating, and real time information (RTIs).

11.4.19 Beyond the site, bus services which serve the site could be given traffic signal priority or other motorists, improving their convenience.

Car Travel

11.4.20 Appropriate car parking provision, in accordance with SDNPA parking standards would be provided. As part of Travel Planning, employment uses could be provided with priority car parking for car sharers, thus reducing the overall number of car parking on site. However, this should be integrated within the Travel Plan proposals and agreed with WSCC.

11.4.21 All elements of the site would look to be equipped with a proportion of active/passive electric vehicle charging points. An electric vehicle charging station could also be proposed on site. This is to facilitate the uptake of electric vehicles which are more environmentally friendly.

Car Clubs

11.4.22 Any subsequent planning application should look to provide car clubs on site. These would be of use to all site users. Liaison with car club operators would look to encourage residents of the site to use car clubs through incentive schemes.

11.4.23 Co-Wheels operates in Worthing, Horsham, and Lewes while Enterprise Car Club operates in Worthing, Brighton, and Shoreham, which are all key employment locations for potential residents of SCW.

11.4.24 According to the *2020 Car Club Annual Report* published by CoMoUK, car clubs replace privately owned cars with a smaller number of more efficiently used vehicles freeing up street space for other uses. When combining the percentages of respondents who had either reduced the number of cars they owned or deferred a purchase we can estimate that 18.5 cars are removed per car club vehicle.

11.4.25 The result of reduced car ownership as a result of car clubs on site would have a positive impact on reducing private car trips associated with the site and could result in reduced traffic impact on the junctions assessed in this transport study.

Active Travel Fund Projects

11.4.26 SCW could also contribute towards Active Travel fund Projects, which could take the form of:

- Cycling Facility in Upper Shoreham Rd; and
- Signalled controlled toucan exiting point on Steyning Road, between Shoreham Tollbridge and Upper Shoreham Road.

11.4.27 Funding and contributions would be agreed between all relevant stakeholders to ensure investment in sustainable transport mitigation is effective.

11.5 Travel Planning (Soft Measures)

11.5.1 Soft sustainable transport measures would be promoted to reduce demand for travel by private car in innovative ways. These may include:

- Personal travel planning
- Workplace travel planning
- Cycling and walking promotion
- Public transport information and marketing

11.5.2 Any subsequent planning application would be required to design, implement, and monitor a travel plan. This would set aims, objectives and targets for improve mode share in favour of sustainable modes and decrease single occupancy car travel where possible.

11.5.3 Travel planning measures would likely take the form of:

- Promotion and marketing material of the travel plan;
- Walking, cycling, and public transport (bus) route maps;
- Links to websites with relevant information regarding walking, cycling and public transport; and
- Promotion of car club and car sharing.

11.5.4 Residents and staff of the site could be incentivised to adopt sustainable modes of transport through voucher schemes for buses and car clubs. This would be subject to discussion and agreement with providers.

11.5.5 Funding for soft sustainable transport measures could be made available by utilising some of the off-site highway contribution costs calculated as per Section 14.9 of this report.

11.6 Funding for Sustainable Transport Mitigation

11.6.1 The Shoreham Cement Works Transport Study has outlined the estimate costs associated with providing junction improvements at key junctions which would be affected by the worst-case scenario trip generation associated with the site.

11.6.2 As has been agreed by WSCC, the contributions of £203,519 for the proposed highway improvements at urban junctions in Shoreham-By-Sea, i.e., A283/Upper Shoreham Road Roundabout, and A283/A259 Roundabout, could be used to allocate funding towards sustainable transport mitigation. In addition to this, the contributions of £30,038 towards improvements at A283/Water Lane junction and £475,874 toward improvement at Washington Roundabout could also be used to fund sustainable transport initiatives as mentioned within this section

12.0 PROPOSED ACCESS ARRANGEMENTS

12.1 Proposed Site Access Arrangement Methodology

12.1.1 ADL have investigated a number of site access arrangement for SCW as part of the transport study. Given the nature of the site's location, and aspirations of SDNPA and WSCC, any proposed site access arrangement would seek to reach a balance between the desire to restore and enhance the natural environment, whilst creating safe access options for all users.

12.1.2 As discussed previously, sustainable transport mitigation could be provided for SCW to reduce the number of vehicle trips associated with the proposed development scenarios. However, for the purpose of this transport study, junction capacity assessment of any proposed site access arrangement has been based on worst-case scenario, using the robust baseline traffic situation, and robust proposed development vehicular trip generation, during the weekday network peak hours.

12.1.3 In line with SDNPA's aim to enhance the natural environment, and offer maximal land for landscaping, ADL tested access options which required minimal change to the existing infrastructure which serves the site, in the first instance, before testing alternative options.

Existing Site Accesses (No Change)

12.1.4 The existing site accesses comprise a left in/left out priority junction at the northern access which serves the eastern portion of the site and an all-movement priority T-junction at the southern access which serves the western portion of the site. Junction capacity assessment demonstrated that these two junctions in their current arrangement would result in severe residual impact in traffic engineering terms due to significant delays, queue lengths and ratio to flow capacity (RFC) both within the site, and on A283.

Existing Site Accesses (All Movements)

12.1.5 ADL then tested the viability of using the existing site accesses, but with all movements for the northern access as well as the southern access and providing right turn lanes

on A283 for right turners into the site. Although an improvement on the existing arrangement, the delay and queues within the site and on A283 were considered severe.

Existing Site Accesses (Left In/Left Out)

12.1.6 A left in/left out priority junction arrangement was explored, whereby the tunnel beneath the A283 would be used to link the two portions of the site, and therefore negate the need for right turn movement from A283 into the site or from site onto A283. However, the dimensions of the existing tunnel do not accommodate the two-way movement of vehicular traffic and therefore it would need to be widened should this arrangement allow all movements between the site and A283.

12.1.7 It should also be noted that given the volume of traffic associated with all four development scenarios, it is not considered appropriate for all non-residential traffic associated with the site to pass through the residential element of the development (on the western portion of the site), i.e., non-residential trips from south entering the eastern portion of the site, or non-residential trips from the north exiting the eastern portion of the site. As such, widening the tunnel to accommodate this two-way movement of traffic is not considered desirable.

Two x Three-Arm Roundabouts

12.1.8 Following this, two moderately sized three-arm roundabouts, both with inscribed circle diameters of 40 metres, at the locations of existing accesses, was explored.

12.1.9 However, it was found that the northern access roundabout exhibits queues of up to 153 vehicles on south arm, and 38 vehicles on north arm., whilst the southern access roundabout exhibits queues of up to 282 vehicles on south arm, 53 vehicles on north arm. It clearly shows that the three-armed moderately sized roundabouts cannot accommodate the traffic on the A283.

12.1.10 Also, given the aspirations of SDNPA, the provision of two sizeable roundabouts to serve the site is not considered to be appropriate and as such, a single four-arm round was explored, at the location of the existing northern access, which would serve both eastern and western portions of the site.

Left-Out/All-In Northern Site Access Junction and Three-Armed Southern Site Access Roundabout

12.1.11 ADL investigated how a left-out/all-in northern site access Junction with three-armed southern site access roundabout would operate from a capacity perspective. This makes the presumption that vehicles originating from the eastern portion of the site would turn left (south) of the northern access and perform a U-turn at the southern access roundabout in order to travel north from the site.

12.1.12 However, it was found that the northern T-junction with right turn lane would exhibit significant queues on the right turn lane with up to 22 vehicles queuing. The queues on the south access (three-armed roundabout) would also be worsened due to additional U-turners associated with the eastern part of the site.

Four-Arm Roundabout

12.1.13 Ultimately, a four-arm roundabout, with inscribed circle diameter of 60 metres, has been considered, at the location of the northern site access. This would enable the existing southern access to be closed.

12.1.14 From a junction capacity perspective, this arrangement is considered to be the only appropriate site access arrangement with no severe traffic impact. This arrangement is considered to balance with the aspirations of SDNPA in terms of environmental impact and impact on landscaping by only providing one point of access.

12.1.15 The access solutions have been developed with Roads in the South Downs guidance (RitSD, 2015) in mind.

12.2 Proposed Site Access Arrangement: Four-Arm Roundabout

12.2.1 As mentioned previously, it is proposed to provide a four-arm roundabout on A283, at the location of the existing northern access to the site. It is proposed to provide three-lane approaches on A283 north and A283 south arms of the roundabout, and two-lane approaches on east and west arms of the roundabout.

12.2.2 Pedestrian crossing points are proposed across all arms, with pedestrian refuge islands, dropped kerbs, and tactile paving. Two-metre-wide footways are proposed along all arms of the junction, and ramped access between the roundabout and the existing underpass beneath the A283 for pedestrians, cyclists, and horse riders.

12.2.3 A plan of the proposed site access arrangement is provided as Appendix 13.1.

12.2.4 For the purpose of Shoreham Cement Works AAP, the proposed site access plan is indicative and would be subject to detailed design at planning application stage. The site access would be developed with Roads in the South Downs guidance (RitSD, 2015) in mind.

12.3 Stage 1 Road Safety Audit

12.3.1 In the interest of highway safety, ADL commissioned Highways Associates (independent auditor) to undertake a Stage 1 Road Safety Audit (RSA) of the proposed site access.

12.3.2 The brief of the RSA was agreed by WSCC on 28th February 2022, and the audit was undertaken on 6th March 2022.

12.3.3 The RSA report is provided as Appendix 13.2. The audit report has identified seven problems:

Problem 1: Risk of excessive approach speeds

ADL Response: It is accepted that at later planning application stage or detailed design stage, measures would be proposed and agreed with SDNPA and WSCC with regards to incorporating advanced warning and map type signage.

Problem 2: Risk of excessive circulating speed due to roundabout geometry

ADL Response: This is accepted. The geometry has been further amended as shown RSA DR Appendix B. This has resulted in achieving appropriate deflection.

Problem 3: *Risk of loss of control / conflict with buses due to alignment*

ADL Response: This is accepted. The southbound bus stop has been relocated further away from the roundabout.

Problem 4: *Risk of side swipe conflicts*

ADL Response: This is accepted. Swept path assessment as requested is provided as RSA DR Appendix C.

Problem 5: *Insufficient pedestrian crossing provision*

ADL Response: This is accepted. The tunnel would be improved in accordance with the LTN 1/20 and would be the main pedestrian crossing route between the eastern and western part of the site and provide connection to Downs Link. Majority of the pedestrians who may choose to use the crossing points on this proposed roundabout are those who would be travelling by bus and therefore require to walk to the proposed bus layby on the A283. It should be noted that as an alternative, there could be bus stops provided on site subject to future Masterplanning. If this occurs, then the number of pedestrians using splitter islands on the roundabout would be very low.

Problem 6: *Right turn arrows could cause driver confusion*

ADL Response: This is accepted. A review of the proposed road markings on the proposed roundabout would be undertaken at a later stage such as planning application stage or detailed design stage, in discussion with SDNPA and WSCC.

Problem 7: *Risk of incursion*

ADL Response: This is accepted. A suitable mitigation measure to protect vehicles from incursion. This will be discussed at a later stage such as planning application stage or detailed design stage, in discussion with SDNPA and WSCC.

12.3.4 The problems raised within the RSA do not suggest that the proposed development would have any material highway safety impact on A283 adjacent to the site, or within the site.

12.4 Junction Capacity Assessment

12.4.1 The proposed four-arm roundabout site access has been assessed for capacity using TRL's Junction's 9 Software.

12.4.2 The junction capacity assessment is based on typical commuter peak hours and during these periods. It is considered that the likelihood of walking (and to some extent, cycling) related improvements is unlikely to tip the balance from private cars to walking (and cycling) to a material extent due to the semi-rural nature of site location and sparsity of trip-attracting destinations in the vicinity of the site. As such, junction capacity assessment has been undertaken to assume worst case scenario, for robustness.

12.4.3 The ARCADY model output for Proposed Development Scenarios in year 2033 is provided as Appendix 13.3. The results are summarised in Table 12A.

Table 12A ARCADY Outputs: Site Access Roundabout – 2033 Total Scenarios

Scenario	Arm	AM Peak Hour			PM Peak Hour		
		Queue	Delay	RFC	Queue	Delay	RFC
1	A283 North	2	5	0.68	2	4	0.62
	Site Access East	0	5	0.22	1	5	0.32
	A283 South	2	4	0.64	4	7	0.79
	Site Access West	0	4	0.11	0	5	0.05
	Total	**4**	**18**	**-**	**7**	**21**	**-**
2	A283 North	2	5	0.67	2	4	0.61
	Site Access East	0	5	0.18	0	5	0.30
	A283 South	2	4	0.63	3	6	0.77
	Site Access West	0	4	0.07	0	5	0.03
	Total	**4**	**18**	**-**	**5**	**20**	**-**
3	A283 North	2	4	0.64	2	4	0.61
	Site Access East	0	4	0.14	0	5	0.24
	A283 South	1	4	0.58	3	6	0.76
	Site Access West	0	4	0.04	0	5	0.02
	Total	**3**	**16**	**-**	**5**	**20**	**-**
4	A283 North	2	5	0.67	1	4	0.59
	Site Access East	0	4	0.10	0	5	0.25
	A283 South	2	4	0.62	3	5	0.74
	Site Access West	0	4	0.04	0	5	0.02
	Total	**4**	**17**	**-**	**4**	**19**	**-**

*Queue = Measured in vehicles
*Delay = Measured in seconds
*RFC = Ratio of flow to capacity

12.4.4 Table 12A demonstrates that the proposed junction arrangement operates within theoretical capacity (i.e., RFC value less than 0.85) in each of the proposed development scenarios. The maximum queue length is four vehicles only on A283, and the maximum delay on any arm in any scenario is seven seconds which is not considered severe.

12.4.5 It should be reiterated that this junction capacity assessment is based on worst-case scenario and is considered to be robust.

12.4.6 Also, it should be reiterated that site access has been assessed during the typical commuter peak hours, where the baseline traffic on A283 and vehicular trip generation of the proposed development scenarios are at their highest levels. Therefore, the capacity of the site access, including delays and queues, would be significantly less outside of these hours and on weekends.

13.0 OFF-SITE JUNCTION CAPACITY ASSESSMENT

13.1 Introduction

13.1.1 A junction capacity assessment has been undertaken for each of the junctions assessed as part of this transport study for the year 2033 using industry standard modeling software, such as TRL's Junctions 9 (for priority junctions and roundabouts) and JCT's LinSig V3 (for signalised junctions). This is compiled in Technical Note 3 and subsequently updated as per discussions with SDNPA, WSCC and NH.

13.1.2 Each of the four development scenarios have been tested against the 2033 Baseline Scenario without development (i.e., 2033 Base + Total Committed Development) to test the impact of the proposed development scenarios.

13.1.3 WSCC state that drivers tend to notice delay over 30 seconds. Delay over two minutes (120 seconds) represents a congested situation and one should avoid delay over three minutes (180 seconds).

13.1.4 Should the proposed development scenarios result in the junction not operating within theoretical capacity (i.e., RFC value greater than 0.85), or significant increase in queue lengths and delays when compared with the 2033 Baseline scenario, ADL have proposed mitigation in the form of junction improvements ensure that the proposed development scenarios would not result in an unacceptable impact on highway safety or cause severe residual cumulative impacts on the road network (National Planning Policy Framework (2021) paragraph 111).

13.1.5 ADL have confirmed that the proposed junction improvements have been made within the constraints of adopted highway extent, as provided by WSCC. The only exception is the Lancing Manor Roundabout (Junction 12) which requires third-party land-take (Lancing Manor Estate).

13.1.6 As mentioned previously, it should be noted that the junction capacity assessment of each of the junctions considers a worst-case scenario, given that no reduction to the vehicular trip rates has been applied.

13.1.7 However, whilst the junction capacity assessments consider a worst-case scenario, transport contributions calculated to mitigate the impact of the development by way of physical highway improvements to certain junctions namely in Shoreham-by-Sea could be used for sustainable transport improvements; and this would apply mostly in urban junctions due to the fact that a large number of trips associated with the development proposals would be concentrated in areas such as Shoreham-by-Sea and as a result, there is an opportunity to maximise sustainable mode share to the trips to this area. Hence, it is considered appropriate that the proposed sustainable initiatives (and funding for these initiatives) to be mainly targeted to those travelling in these areas.

13.2 Junction 1 – A283 / A24 (Washington) Roundabout

13.2.1 The Washington Roundabout, i.e., A283 / A24 junction has been assessed for capacity using TRL's Junction's 9 Software.

Existing Junction Arrangement

13.2.2 The ARCADY model output for Washington Roundabout with existing junction arrangement is provided as Appendix 14.1. The results for 2033 Baseline Scenario are summarised in Table 13A.

Table 13A ARCADY Outputs: Washington Roundabout – 2033 Baseline Scenario

Arm	AM Peak Hour			PM Peak Hour		
	Queue (Veh)	Delay (S)	RFC	Queue (Veh)	Delay (S)	RFC
A283 East	4	16	0.80	5	20	0.83
A24 South	6	13	0.86	2	4	0.63
A283 West	44	124	1.06	10	30	0.93
A24 North	9	21	0.91	162	255	1.17
Total	**63**	**174**	**-**	**179**	**309**	**-**

*Queue = Measured in vehicles
*Delay = Measured in seconds
*RFC = Ratio of flow to capacity

13.2.3 The results for Proposed Development Scenarios, with difference in queue length and delay compared to 2033 Baseline Scenario, are summarised in Table 13B.

Table 13B ARCADY Outputs: Washington Roundabout – 2033 Total Scenarios, with Existing Junction Arrangement

Scenario	Arm	AM Peak Hour					PM Peak Hour				
		Queue		Delay		RFC	Queue		Delay		RFC
		Vehs	Diff.	S	Diff.		Vehs	Diff.	S	Diff.	
1	A283 East	5	+1	18	+2	0.83	5	0	20	0	0.84
	A24 South	7	+1	14	+1	0.87	2	0	4	0	0.63

	Total	**71**	**+8**	**193**	**+19**	**-**	**189**	**+10**	**344**	**+25**	**-**
4	A283 East	4	0	16	0	0.81	5	0	20	0	0.84
	A24 South	6	0	13	0	0.87	2	0	4	0	0.63
	A283 West	51	+7	139	+15	1.07	11	+1	31	+1	0.93
	A24 North	9	0	21	0	0.91	166	+4	264	+9	1.17
	Total	**70**	**+7**	**189**	**+15**	**-**	**184**	**+5**	**319**	**+10**	**-**

*Queue = Measured in vehicles
*Delay = Measured in seconds
*RFC = Ratio of flow to capacity

13.2.4 Table 13B demonstrates that all proposed development scenarios result in an increase in queueing on the A283 West arm of the roundabout during the AM peak hour. The increase in queues is +11 vehicles in Scenario 1; +9 vehicles in Scenario 2; +8 vehicles in Scenario 3; and +7 vehicles in Scenario 4.

13.2.5 Table 13B demonstrates that all proposed development scenarios result in an increase in queueing on the A24 North arm of the roundabout during the PM peak hour. The increase in queues is +12 vehicles in Scenario 1; +5 vehicles in Scenario 2; +6 vehicles in Scenario 3; and +2 vehicles in Scenario 4.

13.2.6 Table 13B demonstrates that the proposed development scenarios result in maximum increase of +26 seconds compared to baseline scenario (Scenario 1, A283 West arm) in the AM peak which remains below three minutes, and +31 seconds in PM peak (A24 North arm). There is shown to be negligible increase, or no increase in delays on the other arms.

Proposed Junction Improvements

13.2.7 Whilst increase in queues and delays on Washington Roundabout as a result of SCW developments is marginal, it is considered a key junction and hence WSCC would expect this junction to be improved. WSCC are working on their own scheme at Washington Roundabout and a proportion of contribution as per the cost estimate within TN3 should be allocated towards this.

13.2.8 ADL proposed the following mitigation to improve the capacity of the junction and minimise the impact of the proposed development scenarios:

A283 West:

- Increase entry width from 8.5 metres to 11.3 metres (i.e., increase from two to three lanes); and
- Lane direction road markings.

A24 North:

- Increase entry width from 8.2 metres to 11.4 metres (i.e., increase from two to three lanes);
- Flare length increased from 4.8 metres to 53 metres; and
- Lane direction road markings – left lane dedicated to left turners, two lanes dedicated for straight ahead and right/U-turners.

A283 East:

- Lane direction road markings.

A24 South:

- Lane direction road markings.

Circulatory lanes:

- Lane direction road markings.

13.2.9 A plan of the proposed junction improvements are provided as Appendix 14.2. The model output for the Proposed Development Scenarios, with proposed junction improvements is provided as Appendix 14.3. The results are summarised in Table 13C.

Table 13C ARCADY Outputs: A283 / A24 Roundabout – 2033 Total Scenarios, with Proposed Junction Improvements

*Queue = Measured in vehicles
*Delay = Measured in seconds
*RFC = Ratio of flow to capacity

13.2.10 Table 13C demonstrates that the proposed junction improvements would result in significant increase the capacity of the junction.

13.2.11 During the AM Peak Hour, compared to the 2033 Base Scenario, the on the A283 West arm, the decrease in queues is -38 vehicles in Scenario 1; and -39 vehicles in Scenario 2, 3 and 4. In all proposed development scenarios, there would be decrease of -7 vehicles on A24 North arm during AM peak hour. Delays on these arms would also decrease by at least -106 seconds on A283 West, and -16 seconds on A24 North.

13.2.12 Table 12C also shows that during the PM peak hour, in all proposed development scenarios compared to the 2033 Base Scenario, on the A24 North arm there would be decrease of at least -156 vehicle queues and -245 seconds delay, and on the A283 West arm there would be decrease of -7 vehicle queues and -21 second delays.

13.2.13 Whilst the proposed junction improvements do incur an increase in queue lengths and delay on the A283 East arm of the roundabout, during the PM peak hour, the total queues and delays are significantly decreased compared the 2033 Baseline Scenario in all proposed development scenarios.

13.3 Junction 2 – A283 / Water Lane / Chanctonbury Ring Road Crossroads

13.3.1 The A283 / Water Lane / Chanctonbury Ring Road crossroads junction has been assessed for capacity using TRL's Junction's 9 Software.

Existing Junction Arrangement

13.3.2 The PICADY model output for Water Lane Crossroads with existing junction arrangement is provided as Appendix 15.1. The results for 2033 Baseline Scenario are summarised in Table 13D.

Table 13D PICADY Outputs: A283 / Water Lane – 2033 Baseline Scenario

Arm	AM Peak Hour			PM Peak Hour		
	Queue	Delay	RFC	Queue	Delay	RFC
Chanctonbury Ring Road (Left Out)	0	22	0.03	2	1366	99999999

	Total	**5**	**+1**	**353**	**+80**	**-**	**37**	**+3**	**3337**	**+52**	**-**

*Queue = Measured in vehicles *Delay = Measured in seconds *RFC = Ratio of flow to capacity

13.3.4 Table 13E shows that the junction operates within theoretical capacity (i.e., RFC value of less than 0.85) under all development scenarios, with negligible increase in queues in the AM peak hour.

13.3.5 Table 13E also shows that all proposed development scenarios result in an increase in queueing on Water Lane (left out) during the PM peak hour. The increase in queues is +11 vehicles in Scenario 1; +7 vehicles in Scenario 2; +6 vehicles in Scenario 3; and +3 vehicles in Scenario 4.

Proposed Junction Improvements

13.3.6 It is proposed to provide the following mitigation to improve the capacity of the junction and minimise the impact of the proposed development scenarios:

Water Lane:

- Increase width to 6.0 metres at 10 metres back from give-way, and up to 5.5 metres at 15 metre back from give-way (i.e., increase flare length from two PCU to three PCU); and
- Increase visibility to left onto A283 to 100 metres – WSCC to maintain the vegetation within adopted highway extent.

13.3.7 A plan of the proposed junction improvements are provided as Appendix 15.2. The model output for the Proposed Development Scenarios, with proposed junction improvements is provided as Appendix 15.3. The results are summarised in Table 13F.

Table 13F PICADY Outputs: A283 / Water Lane – 2033 Total Scenarios, with Proposed Junction Arrangement

Scenario	Arm	AM Peak Hour					PM Peak Hour

*Queue = Measured in vehicles
*Delay = Measured in seconds
*RFC = Ratio of flow to capacity

13.3.8 Table 13F shows that the proposed junction improvements improve the capacity of the junction in terms of queues and delays, compared to the 2033 Base scenario.

WSCC confirmed that there would be no need to improve the A283/Water Lane crossroads as any improvements are likely to result in an increase in rat-running along Water Lane which would not be desirable.

13.4 Junction 3 – A283 / B2135 / Horsham Road Junctions

13.4.1 The A283 / B2135 / Horsham Road junctions have been assessed for capacity using TRL's Junction's 9 Software.

Existing Junction Arrangement

A283 / B2135 Junction

13.4.2 PICADY model output for A283 / B2135 priority T-junction with existing junction arrangement is provided as Appendix 16.1. The results for 2033 Baseline Scenario are summarised in Table 13G.

Table 13G PICADY Outputs: A283 / B2135 – 2033 Baseline Scenario

Arm	AM Peak Hour			PM Peak Hour

*Queue = Measured in vehicles
*Delay = Measured in seconds
*RFC = Ratio of flow to capacity

13.4.6 Tables 13I and 13J demonstrates that the two junctions would continue to operate within theoretical capacity (RFC value of 0.85) under all proposed development scenarios. All development scenarios do not result in significant increase in queueing or delay on all arms of the junction during AM and PM peak hours. As such it is not deemed necessary to propose any mitigation at these junctions.

13.5 Junction 4 – A283 / Maudlin Lane / Clays Hill / Castle Lane / The Street Roundabout

13.5.1 The A283 / Maudlin Lane / Clays Hill / Castle Lane / The Street Roundabout has been assessed for capacity using TRL's Junction's 9 Software.

Existing Junction Arrangement

13.5.2 ARCADY model output with existing junction arrangement is provided as Appendix 17.1. The results for 2033 Baseline Scenario are summarised in Table 13K.

Table 13K ARCADY Outputs: A283 / Clays Hill Roundabout – 2033 Baseline Scenario

Arm	AM Peak Hour			PM Peak Hour		
	Queue	Delay	RFC	Queue	Delay	RFC

	The Street	1	0	8	0	0.33	1	0	7	0	0.34
	Total	**78**	**+10**	**261**	**+23**	**-**	**183**	**+12**	**546**	**+28**	**-**

*Queue = Measured in vehicles *Delay = Measured in seconds *RFC = Ratio of flow to capacity

13.5.4 Table 13L demonstrates that all development scenarios result in increased queuing and delay on the A283 South arm of the roundabout during AM and PM peak hours. There is no increase, or only minor increase in queue or delay on all other arms of the roundabout.

Proposed Junction Improvements

13.5.5 It is proposed to provide the following mitigation to improve the capacity of the junction and minimise the impact of the proposed development scenarios:

A283 South:

- Increase entry width from 6.7 metres to 7.2 metres (i.e., increase effective flare length from 8.0 metres to 23.5 metres).

13.5.6 A plan of the proposed junction improvements are provided as Appendix 17.2. The model output for the Proposed Development Scenarios, with proposed junction improvements is provided as Appendix 17.3. The results are summarised in Table 13M.

Table 13M ARCADY Outputs: A283 / Clays Hill Roundabout – 2033 Total Scenarios, with Proposed Junction Improvements

*Queue = Measured in vehicles
*Delay = Measured in seconds
*RFC = Ratio of flow to capacity

13.5.7 Table 13M demonstrates that the proposed junction improvements would significantly increase the capacity of the junction, by decreasing the queue lengths and delay on the A283 South arm of the roundabout. In the AM peak hour, on the A283 South arm, the queue length decreases by -35 vehicles in Scenario 1; -37 vehicles in Scenario 2; -38 vehicles in Scenario 3; and -39 vehicles in Scenario 4.

13.5.8 In the PM peak hour, on the A283 South arm, the queue length decreases by -81 vehicles in Scenario 1; -83 vehicles in Scenario 2; -82 vehicles in Scenario 3; and -88 vehicles in Scenario 4.

13.5.9 Whilst Table 13M shows that the proposed junction arrangement would decrease queues on the A283 South arm, there would be some increase in queue length on Clays Hill (maximum increase of +9 vehicles in Scenario 1) and on A283 North arm (maximum increase of +1 vehicle). However, Table 13M demonstrates that the total queues across the roundabout during the peak hours would be significantly decreased, thus improving the performance of the junction.

13.6 Junction 5 – A283 / A2037 Roundabout

13.6.1 The A283 / A2037 junction has been assessed for capacity using TRL's Junction's 9 Software.

Existing Junction Arrangement

13.6.2 ARCADY model output with existing junction arrangement is provided as Appendix 18.1. The results for 2033 Baseline Scenario are summarised in Table 13N.

Table 13N ARCADY Outputs: A283 / A2037 Roundabout – 2033 Baseline Scenario

Arm	AM Peak Hour			PM Peak Hour		
	Queue	Delay	RFC	Queue	Delay	RFC
A2037	4	19	0.81	4	16	0.79

*Queue = Measured in vehicles
*Delay = Measured in seconds
*RFC = Ratio of flow to capacity

13.6.4 Table 13O demonstrates that all development scenarios do not result in significant increase in queueing or delay on all arms of the junction during AM and PM peak hours. As such it is not deemed necessary to propose any mitigation at this junction.

13.7 Junction 8 – A283 / A27 Slips Roundabout

13.7.1 The A283 / A27 Slips junction has been assessed for capacity using TRL's Junction's 9 Software.

Existing Junction Arrangement

13.7.2 ARCADY model output with existing junction arrangement is provided as Appendix 19.1. The results for 2033 Baseline Scenario are summarised in Table 13P.

Table 13P ARCADY Outputs: A283 / A27 Slips Roundabout – 2033 Baseline Scenario

Arm	AM Peak Hour			PM Peak Hour		
	Queue	Delay	RFC	Queue	Delay	RFC

*Queue = Measured in vehicles
*Delay = Measured in seconds
*RFC = Ratio of flow to capacity

13.7.4 Table 13Q demonstrates that under all development scenarios, there would be increased queuing and delays on A283 South arm of the roundabout during AM peak, and on A283 North arm under Scenario 1 and 2.

13.7.5 Table 13Q also demonstrates that under all development scenarios, there would be increased queuing and delays on A27 westbound slips and A283 South arms of the roundabout during PM peak, and on A283 North arm under Scenario 1 and 2.

Proposed Junction Improvements

13.7.6 It is proposed to provide the following mitigation to improve the capacity of the junction and minimise the impact of the proposed development scenarios:

A27 Westbound Slips:

- Increase entry width from 7.4 metres to 11.3 metres (i.e., increase flare length from 12.2 metres to 32.5 metres);
- Dedicated left hand lane for A283 South traffic; and
- Lane direction road markings.

A283 South:

- Increase entry width from 9.7 metres to 12.0 metres (i.e., increase flare length from 4.1 metres to 26.4 metres);
- Dedicated left hand lane for A283 North traffic; and
- Lane direction road markings.

A283 North:

- Increase entry width from 7.0 metres to 11.2 metres (i.e., increase flare length from 11.5 metres to 26.3 metres);
- Dedicated left hand lane for A27 Eastbound traffic; and
- Lane direction road markings.

A27 Eastbound Slips:

- Increase entry width from 6.6 metres to 11.1 metres (i.e., increase flare length from 11.5 metres to 37.4 metres);
- Dedicated left hand lane for A27 Westbound traffic and
- Lane direction road markings.

Circulatory Lanes:

- Increase from two lanes to three lanes;
- Lane direction road markings.

13.7.7 A plan of the proposed junction improvements are provided as Appendix 19.2. The model output for the Proposed Development Scenarios, with proposed junction improvements is provided as Appendix 19.3. The results are summarised in Table 12R.

Table 13R ARCADY Outputs: A283 / A27 Slips Roundabout – 2033 Total Scenarios, with Proposed Junction Improvements

*Queue = Measured in vehicles
*Delay = Measured in seconds
*RFC = Ratio of flow to capacity

13.7.8 Table 13Q demonstrates that the proposed junction improvements would result in all arms of the roundabout operating with theoretical capacity (i.e., RFC of less than 0.85) in all proposed development scenarios in AM and PM peak hours.

13.7.9 Table 13Q also demonstrates that there would be significantly decrease in queuing, with maximum queue length of two vehicles in AM peak (on A283 South and A293 North arms), and maximum queue length of three vehicles in PM peak (on A27 Westbound slips arm). Also, delays are decreased significantly on all arms in all scenarios.

DMRB CD 116 Compliance Checks

13.7.10 The proposed junction arrangement adheres to DMRB CD 116 (Geometric design of roundabouts). This document provides the geometric design requirements for roundabouts applicable to new and improved junctions on trunk roads. Compliance checks are provided as Appendix 19.4.

13.8 Junction 9 – A283 / Upper Shoreham Road Roundabout

13.8.1 The A283 / Upper Shoreham Road junction has been assessed for capacity using TRL's Junction's 9 Software.

Existing Junction Arrangement

13.8.2 ARCADY model output with existing junction arrangement is provided as Appendix 20.1. The results for 2033 Baseline Scenario are summarised in Table 13S.

Table 13S ARCADY Outputs: A283 / Upper Shoreham Road Roundabout – 2033 Baseline Scenario

Arm	AM Peak Hour			PM Peak Hour		
	Queue	Delay	RFC	Queue	Delay	RFC
Upper Shoreham Road	6	30	0.88	9	40	0.91
A283 South	25	138	1.04	26	135	1.04
A283 North	50	196	1.10	239	1048	1.43
Total	**81**	**364**	**-**	**274**	**1223**	**-**

*Queue = Measured in vehicles
*Delay = Measured in seconds
*RFC = Ratio of flow to capacity

13.8.3 The results for the Proposed Development Scenarios, with difference in queue length and delay compared to 2033 Baseline, are summarised in Table 13T.

Table 13T ARCADY Outputs: A283 / Upper Shoreham Road Roundabout – 2033 Total Scenarios, with Existing Junction Arrangement

Scenario	Arm	AM Peak Hour					PM Peak Hour				
		Queue		Delay		RFC	Queue		Delay		RFC
		Vehs	Diff.	S	Diff.		Vehs	Diff.	S	Diff.

	A283 North	52	+2	211	+15	1.10	277	+38	1231	+83	1.48
	Total	**105**	**+24**	**474**	**+110**	**-**	**318**	**+44**	**1431**	**+108**	**-**

*Queue = Measured in vehicles *Delay = Measured in seconds *RFC = Ratio of flow to capacity

13.8.4 Table 13T demonstrates that all proposed development scenarios result in increased queues and delays on all arms of the roundabout during AM and PM peak hours.

Proposed Junction Improvements

13.8.5 It is proposed to provide the following mitigation to improve the capacity of the junction and minimise the impact of the proposed development scenarios:

A283 South:

- Increase entry width from 4.5 metres to 6.2 metres (effective flare length increase from 2.8 metres to 22.1 metres) by realigning the western kerbline within adopted highway,

A283 North:

- Increase entry width from 4.5 metres to 5.5 metres (effective flare length increase from 0.8 metres to 2.8 metres) by realigning the northeastern kerbline, and amending the splitter island.

Distance Between Arms:

- Increase distance between arms (i.e., increase size of roundabout):
  - Between A283 South and A283 North, from 17.7 metres to 18.3 metres;

- Between A283 North and Upper Shoreham Road, from 15.4 metres to 16.7 metres;
- Between Upper Shoreham Road and A283 South, from 15.9 metres to 16.8 metres.

13.8.6 A plan of the proposed junction improvements are provided as Appendix 20.2. The model output for the Proposed Development Scenarios, with proposed junction improvements is provided as Appendix 20.3. The results are summarised in Table 13U.

Table 13U ARCADY Outputs: A283 / Upper Shoreham Road Roundabout – 2033 Total Scenarios, with Proposed Junction Improvements

Scenario	Arm	AM Peak Hour					PM Peak Hour				
		Queue		Delay		RFC	Queue		Delay		RFC
		Vehs	Diff.	S	Diff.		Vehs	Diff.	S	Diff.	
1	Upper Shoreham Rd	9	+3	43	+13	0.92	14	+5	65	+25	0.97
	A283 South	4	-21	24	-114	0.82	4	-22	21	-114	0.80

2	Upper Shoreham Rd	9	+3	42	+12	0.92	14	+5	63	+23	0.96
	A283 South	4	-21	24	-114	0.82	4	-22	20	-115	0.79
	A283 North	41	-9	153	-43	1.07	247	+8	1006	-42	1.44
	Total	**54**	**-27**	**219**	**-145**	**-**	**265**	**+11**	**1089**	**-134**	**-**
3	Upper Shoreham Rd	8	+2	38	+8	0.91	13	+4	59	+19	0.96
	A283 South	3	-22	19	-119	0.78	4	-22	20	-115	0.79
	A283 North	36	-14	138	-58	1.06	222	-17	896	-152	1.40
	Total	**47**	**-34**	**195**	**-169**	**-**	**239**	**-35**	**975**	**-248**	**-**
4	Upper Shoreham Rd	9	+3	40	+10	0.92	12	+3	56	+16	0.95
	A283 South	4	-21	24	-114	0.82	3	-23	19	-116	0.78
	A283 North	35	-35	136	-60	1.05	223	-16	900	-148	1.40
	Total	**48**	**-33**	**200**	**-164**	**-**	**238**	**-36**	**975**	**-248**	**-**

*Queue = Measured in vehicles
*Delay = Measured in seconds
*RFC = Ratio of flow to capacity

13.8.7 Table 13U demonstrates that the proposed junction improvements would result in decreased queuing on A283 South and A283 North arms of the roundabout under all development scenarios in AM peak hour. There would continue to be minor increase in queuing on Upper Shoreham Road.

13.8.8 Table 13U demonstrates that the proposed junction improvements would result in decreased queuing on A283 South arm in all development scenarios in PM peak hour. There would also be decrease queuing on A283 North arm in Scenario 3 and 4.

WSCC confirmed that they would not be looking to make any physical improvements to the urban roundabouts to the south of the A27 i.e. A283/Upper Shoreham Road and A283/A259. The contributions calculated for physical improvements could be put forward towards improving sustainable transport infrastructure in the area instead.

13.9 Junction 10 – A283 / A259 Roundabout

13.9.1 The A283 / A259 junction has been assessed for capacity using TRL's Junction's 9 Software.

Existing Junction Arrangement

13.9.2 ARCADY model output with existing junction arrangement is provided as Appendix 21.1. The results for 2033 Baseline Scenario are summarised in Table 13V.

Table 13V ARCADY Outputs: A283 / A259 Roundabout – 2033 Baseline Scenario

Arm	AM Peak Hour			PM Peak Hour		
	Queue	Delay	RFC	Queue	Delay	RFC
A259 East	29	110	1.03	326	1373	1.65
A259 West	356	1221	1.48	64	175	1.09

	A259 West	368	+12	1267	+46	1.49	67	+3	187	+12	1.10
	A283	1	0	9	0	0.58	13	+3	58	+12	0.96
	Total	**401**	**+15**	**1395**	**+55**	**-**	**428**	**+28**	**1720**	**+126**	**-**
4	A259 East	38	+9	136	+26	1.06	342	+16	1452	+79	1.68
	A259 West	394	+38	1368	+147	1.52	66	+2	183	+8	1.10
	A283	1	0	9	0	0.58	13	+3	59	+13	0.96
	Total	**433**	**+47**	**1513**	**+173**	**-**	**421**	**+21**	**1694**	**+100**	**-**

*Queue = Measured in vehicles
*Delay = Measured in seconds
*RFC = Ratio of flow to capacity

13.9.4 Table 13W demonstrates that under all development scenarios, there is increased queueing and delays on A259 East and A259 West arms of the roundabout in the AM peak hour, and on all arms of the junction in PM peak hour.

Proposed Junction Improvements

13.9.5 It is proposed to provide the following mitigation to improve the capacity of the junction and minimise the impact of the proposed development scenarios:

Roundabout Size:

- Increase size of roundabout from ICD of 26 metres to ICD of 28.5 metres; and
- Give way lines for A259 West and A283 arms of roundabout moved back, making sure visibilities work.

A259 West:

- Decrease entry width from 7.0 metres to 6.6 metres, effective flare length increased from 1.9 metres to 26 metres.

13.9.6 A plan of the proposed junction improvements are provided as Appendix 21.2. The model output for the Proposed Development Scenarios, with proposed junction improvements is provided as Appendix 21.3. The results are summarised in Table 13X.

Table 13X ARCADY Outputs: A283 / A259 Roundabout – 2033 Total Scenarios, with Proposed Junction Improvements

	A283	1	0	6	-3	0.48	2	-8	8	-38	0.66
	Total	**14**	**-372**	**48**	**-1292**	**-**	**81**	**-319**	**227**	**-1368**	**-**

*Queue = Measured in vehicles
*Delay = Measured in seconds
*RFC = Ratio of flow to capacity

13.9.7 Table 13X demonstrates that the proposed junction improvements result in a significant decrease in queuing and delays on A259 East and A259 West arms of the roundabout (with no increase in queuing on A283 North) in the AM peak hour. The proposed junction improvements result in a significant decrease in queuing and delays on all arms of the roundabout in the PM peak hour.

13.9.8 However, Table 13X also shows that the RFC value on A259 West arm remains above 0.85 in all proposed scenarios in AM peak hour. This is the case for A259 East arm in PM peak hour, with significant queue lengths and delays.

13.10 Junction 11 – A27 / New Monks Farm Signal Roundabout

13.10.1 The committed New Monks Farm signal junction (between A27 / Old Shoreham Road) has been assessed for capacity using JCT's LinSig V3 Software.

Committed Junction Arrangement

13.10.2 The committed junction plan is described in Section 3.5. The plan of the committed junction arrangement (i.e., Vectos drawing number VN201557/PL-03) is provided as Appendix 3.2.

13.10.3 The LinSig model output for 2033 Baseline Scenario and Proposed Development Scenarios is provided as Appendix 22.1. The results for the 2033 Baseline Scenario are summarised in Table 13Y.

Table 13Y LinSig Outputs: A27 / New Monks Farm – 2033 Baseline Scenario

Arm/Lane		AM Peak Hour			PM Peak Hour		
		DoS	Delay	Queue	DoS	Delay	Queue
1/1	A27 East Left Ahead	72.2%	9	15	69.8%	9	14
1/2	A27 East Ahead	60.2%	7	10	61.7%	7	10
1/3	A27 East Ahead	60.3%	7	10	61.7%	7	10
2/1	Old Shoreham Rd (New Monks Farm Access) Left	47.1%	45	4	69.8%	47	8

	3/3	A27 West Ahead	83.2%	19	0	22	+1	90.8%	37	+2	25	+1
	4/1	Sussex Pad Left Ahead	36.2%	35	0	2	0	44.8%	25	+1	3	0
	Total		**-**	**223**	**+1**	**115**	**+3**	**-**	**515**	**+10**	**169**	**+7**

*DoS = Degree of Saturation (%)
*Delay = Average Delays Per PCU, measured in seconds per hour
*Queue = Mean Max Queue, measured in PCUs

13.10.5 Table 13Z shows that, with the exception of the Old Shoreham Road (Left Ahead) arm in the PM peak hour, all arms/lanes in both AM and PM peak hours in all proposed development scenarios operate within theoretical capacity (i.e., DoS less than 100%) with committed junction arrangement.

13.10.6 It should be noted that on the Old Shoreham Road (Left Ahead) arm in the PM peak hour, there would be no increase the DoS, queue length or delay in all development scenarios and therefore they result in nil detriment compared to the baseline scenario.

13.10.7 In light of the above, it is considered that there is no requirement to propose improvements to the committed junction arrangement.

13.11 Junction 12 – A27 / A2025 (Lancing Manor) Roundabout

13.11.1 The Lancing Manor Roundabout, i.e., A27 / A2025 Grinstead Lane / Manor Road junction has been assessed for capacity using TRL's Junction's 9 Software.

Committed Junction Arrangement

13.11.2 As part of planning permission re. AWDM/0961/17, an agreement between Highways England (now National Highways) and Adur District Council and the New Monks Farm applicant requires that the Monks Farm applicant either enters into a S278 Agreement to undertake traffic improvements to the Lancing Manor Roundabout in accordance with Vectos' drawing number VN40408/PL-010 or pays a contribution in full for the cost of the works. The junction improvements as per Vectos' drawing number VN40408/PL-010 is therefore regarded as 'committed highway improvements' and are therefore used to assess the baseline as well as development scenario traffic impact associated with Shoreham Cement Works study.

13.11.3 As such, the Lancing Manor Roundabout has been modelled as per ARCADY outputs provided by Vectos in the Transport Assessment for the New Monks Farm development. A plan of the committed junction arrangement is provided as Appendix 3.3.

13.11.4 ARCADY model output with committed junction arrangement is provided as Appendix 23.1. The results for 2033 Baseline Scenario are summarised in Table 13AA.

Table 13AA ARCADY Outputs: Lancing Manor Roundabout – 2033 Baseline Scenario with Committed Junction Arrangement

Arm	AM Peak Hour			PM Peak Hour		
	Queue	Delay	RFC	Queue	Delay	RFC
A27 East	342	512	1.25	446	649	1.30
A2025	542	2131	1.72	7	34	0.89
A27 West	361	633	1.29	508	961	1.45
Manor Road	23	176	1.06	1	16	0.53
Total	**1,268**	**3,452**	**-**	**963**	**1,660**	**-**

*Queue = Measured in vehicles
*Delay = Measured in seconds
*RFC = Ratio of flow to capacity

13.11.5 The results for the Proposed Development Scenarios, with difference in queue length and delay compared to 2033 Baseline, are summarised in Table 13AB.

Table 13AB ARCADY Outputs: Lancing Manor Roundabout – 2033 Total Scenarios, with Committed Junction Arrangement

Scenario	Arm	AM Peak Hour					PM Peak Hour				
		Queue		Delay		RFC	Queue		Delay		RFC
		Vehs	Diff.	S	Diff.		Vehs	Diff.	S	Diff.

	Manor Road	25	+2	189	+13	1.07	1	0	17	+1	0.54
	Total	**1,396**	**+128**	**3,674**	**+222**	**-**	**1,085**	**+122**	**1,842**	**+182**	**-**
3	A27 East	375	+33	554	+42	1.27	501	+55	721	+72	1.33
	A2025	552	+10	2,159	+28	1.57	8	+1	37	+3	0.90
	A27 West	382	+21	669	+36	1.73	536	+28	1,012	+51	1.47
	Manor Road	24	+1	180	+4	1.06	1	0	17	+1	0.54
	Total	**1,333**	**+65**	**3,562**	**+110**	**-**	**1,015**	**+52**	**1,787**	**+127**	**-**
4	A27 East	367	+25	544	+42	1.26	507	+61	729	+80	1.33
	A2025	563	+21	2,200	+69	1.74	7	0	33	-1	0.88
	A27 West	411	+50	714	+81	1.32	520	+12	981	+20	1.46
	Manor Road	25	+2	191	+15	1.07	1	0	17	+1	0.54
	Total	**1,366**	**+98**	**3,649**	**+197**	**-**	**1,035**	**+72**	**1,760**	**+100**	**-**

*Queue = Measured in vehicles
*Delay = Measured in seconds
*RFC = Ratio of flow to capacity

13.11.6 Table 13AB shows that all proposed development scenarios result in an increase in queueing on the A27 East arm and A27 West arm of the roundabout during the AM and PM peak hours. Despite a decrease in queues on A2025 Grinstead Lane and Manor Road in the AM peak hour, and on Grinstead Lane in PM peak hour, the total queues increase in all development scenarios.

Proposed Junction Improvements

13.11.7 It is proposed to provide the following mitigation to improve the capacity of the junction further and minimise the impact of the proposed development scenarios:

Roundabout Size:

- Increase size of roundabout to ICD of 60 metres; and
- Circulatory lanes broadly as per committed arrangement, with additional road markings and directional arrows

A27 East

- Increase entry width from 9.8 metres to 11.3 metres

A2025 Grinstead Lane:

- Increase entry width from 11.5 metres to 12.8 metres (effective flare length increased from 10.0 metres to 15.0 metres)

A27 West:

- Increase entry width from 11.5 metres to 13.1 metres

Manor Road:

- Increase approach road half width from 4.1 metres to 5.4 metres
- Increase entry width from 7.4 metres to 8.0 metres

It should be noted that these improvements require land take from Lancing Manor Estate.

13.11.8 A plan of the proposed junction improvements are provided as Appendix 23.2. The model output for the Proposed Development Scenarios, with proposed junction improvements is provided as Appendix 23.3. The results are summarised in Table 13AC.

Table 13AC ARCADY Outputs: Lancing Manor Roundabout – 2033 Total Scenarios, with Proposed Junction Improvements

	Total	**932**	**-336**	**2,251**	**-1,201**	**-**	**652**	**-311**	**1,070**	**-590**	**-**

*Queue = Measured in vehicles
*Delay = Measured in seconds
*RFC = Ratio of flow to capacity

13.11.9 Table 13AC demonstrates that the proposed junction improvements would produce significant decrease in queueing compared to the 2033 Baseline Scenario with the committed junction arrangement.

13.11.10 The proposed junction arrangement adheres to DMRB CD 116 (Geometric design of roundabouts). This document provides the geometric design requirements for roundabouts applicable to new and improved junctions on trunk roads. Compliance checks are provided as Appendix 23.4.

14.0 BUDGET COST ESTIMATE FOR OFF-SITE HIGHWAY WORKS

14.1 Introduction

14.1.1 Where off-site highways improvements have been proposed as mitigation, a budget cost estimate has been drawn up for each of the affected junctions.

14.1.2 These is a budget estimate only, which excludes design and council fees, and underground service diversion costs and costs to purchase third party land (in the case of Lancing Manor Roundabout). It has been assumed that the existing road, where retained, will be resurfaced and the whole gyratory has been resurfaced. ADL are not qualified quantity surveyors and the estimates provided should not be used for any contract documents.

14.1.3 As requested by WSCC an optimism bias of 46% has been applied to all cost estimates.

14.2 Junction 1 – Washington Roundabout

14.2.1 A summary of the budget cost estimate for the off-site highways works for the proposed junction improvements at the Washington Roundabout is provided in Table 14A.

Table 14A Budget Cost Estimate: A283 / A24 Roundabout

Item	Description	Cost (£)
	Preliminaries 15%	£35,670.00
1.0	Site Clearance Works	£17,786.00
2.0	Earthworks	£58,749.00
3.0	Pavement	£143,267.00
4.0	Drainage	£5,500.00
5.0	Signs and Markings	£12,500.00
6.0	Other	£22,837.50
	Total	**£296,310**
	Contingency 10%	£29,631
	Civils Total	£325,941
	Including Optimism Bias (46%)	**£475,874**

14.2.2 Full details for the budget cost estimate are provided as Appendix 24.1.

14.3 Junction 2 – A283 / Water Lane / Chanctonbury Ring Road Crossroads

14.3.1 A summary of the budget cost estimate for the off-site highways works for the proposed junction improvements is provided in Table 14B.

Table 14B Budget Cost Estimate: A283 / Water Lane

Item	Description	Cost (£)
	Preliminaries 15%	£2,178.75
1.0	Site Clearance Works	£1,515.00
2.0	Earthworks	£2,736.00
3.0	Pavement	£8,524.00
4.0	Drainage	£0.00
5.0	Signs and Markings	£1,750.00
6.0	Other	£2,000.00
	Total	**£18,704**
	Contingency 10%	£1,870
	Civils Total	£20,574
	Including Optimism Bias (46%)	**£30,038**

14.3.2 Full details for the budget cost estimate are provided as Appendix 24.2.

14.3.3 As discussed previously, it is not proposed to improve this junction as there are fears that such improvements could result in an increase in rat-running along Water Lane. Hence the budget cost of £30,038 could be out towards sustainable transport measures.

14.4 Junction 4 – A283 / Clays Hill

14.4.1 A summary of the budget cost estimate for the off-site highways works for the proposed junction improvements is provided in Table 14C.

Table 14C Budget Cost Estimate: A283 / Clays Hill Roundabout

Item	Description	Cost (£)
	Preliminaries 15%	£5,011.95
1.0	Site Clearance Works	£6,644.00
2.0	Earthworks	£6,328.00
3.0	Pavement	£13,991.00
4.0	Drainage	£2,200.00
5.0	Signs and Markings	£4,250.00
6.0	Other	£5,500.00
	Total	**£43,925**
	Contingency 10%	£4,392
	Civils Total	£48,317
	Including Optimism Bias (46%)	**£70,543**

14.4.2 Full details for the budget cost estimate are provided as Appendix 24.3.

14.5 Junction 8 – A283 / A27 Slips Roundabout

14.5.1 A summary of the budget cost estimate for the off-site highways works for the proposed junction improvements is provided in Table 14D.

Table 14D Budget Cost Estimate: A283 / A27 Slips Roundabout

Item	Description	Cost (£)
	Preliminaries 15%	£54,804.30
1.0	Site Clearance Works	£31,655.00
2.0	Earthworks	£112,263.00
3.0	Pavement	£207,944.00
4.0	Drainage	£0.00
5.0	Signs and Markings	£13,500.00
6.0	Other	£57.362.50
	Total	**£477,529**
	Contingency 10%	£47,753
	Civils Total	£525,282
	Including Optimism Bias (46%)	**£766,912**

14.5.2 Full details for the budget cost estimate are provided as Appendix 24.4.

14.6 Junction 9 – A283 / Upper Shoreham Road Roundabout

14.6.1 A summary of the budget cost estimate for the off-site highways works for the proposed junction improvements is provided in Table 14E.

Table 14E Budget Cost Estimate: A283 / Upper Shoreham Road Roundabout

Item	Description	Cost (£)
	Preliminaries 15%	£8,405.18
1.0	Site Clearance Works	£7,922.00
2.0	Earthworks	£10,427.00
3.0	Pavement	£27,335.00
4.0	Drainage	£4,400.00
5.0	Signs and Markings	£5,950.00
6.0	Other	£9,600.00
	Total	**£74,040**
	Contingency 10%	£7,404
	Civils Total	£81,144
	Including Optimism Bias (46%)	**£118,908**

14.6.2 Full details for the budget cost estimate are provided as Appendix 24.5.

14.6.3 As discussed previously, it is not proposed to improve this junction as WSCC confirmed that they would not be looking to make any physical improvements to the urban roundabouts to the south of the A27 i.e. A283/Upper Shoreham Road and A283/A259. The budget cost of £118,908 could be out towards sustainable transport measures.

14.7 Junction 10 – A283 / A259 Roundabout

14.7.1 A summary of the budget cost estimate for the off-site highways works for the proposed junction improvements is provided in Table 14F.

Table 14F Budget Cost Estimate: A283 / A259 Roundabout

Item	Description	Cost (£)
	Preliminaries 15%	£6,350.10
1.0	Site Clearance Works	£6,875.00
2.0	Earthworks	£7,415.00
3.0	Pavement	£17,344.00
4.0	Drainage	£0.00
5.0	Signs and Markings	£10,700.00
6.0	Other	£4,000.00
	Total	**£52,684**
	Contingency 10%	£5,268
	Civils Total	£57,953
	Including Optimism Bias (46%)	**£84,611**

14.7.2 Full details for the budget cost estimate are provided as Appendix 24.6.

14.7.3 As discussed previously, it is not proposed to improve this junction as WSCC confirmed that they would not be looking to make any physical improvements to the urban roundabouts to the south of the A27 i.e. A283/Upper Shoreham Road and A283/A259. The budget cost of £84,611 could be out towards sustainable transport measures.

14.8 Junction 12 – A27 / A2025 (Lancing Manor) Roundabout

14.8.1 A summary of the budget cost estimate for the off-site highways works associated with the committed junction arrangements and ADL's proposed junction arrangements is provided in Table 14G.

14.8.2 The costs associated with the ADL's proposed junction arrangements have been calculated on the assumption that committed junction as per Vectos' drawing number VN40408/PL-010 is not built by 2033.

Table 14G Budget Cost Estimate: Lancing Manor Roundabout

		Committed Junction Arrangement	ADL Proposed Arrangement	Difference
Item	**Description**	**Cost (£)**	**Cost (£)**	**Cost (£)**
	Preliminaries 15%	£25,993.86	£66,238.47	£40,244.61
1.0	Site Clearance Works	£27,933.00	£55,084.00	£27,151.00
2.0	Earthworks	£37,995.40	£158,493.80	£120,498.40
3.0	Pavement	£91,764.00	£183,812.00	£92,048.00
4.0	Drainage	£5,500.00	£18,200.00	£12,700.00
5.0	Signs and Markings	£10,100.00	£26,000.00	£15,900.00
6.0	Other	£33,250.00	£55,475.00	£22,225.00
	Total	**£232,536.00**	**£563,303.00**	**£330,767.00**
	Contingency 10%	£23,254	£56,330.00	£33,076.00
	Civils Total	£255,790	£619,634	£363,844
	Including Optimism Bias (46%)	**373,453**	**£904,666**	**£531,213**

14.8.3 Table 14G shows that the committed junction arrangement could cost approximately £256,000 to construct, whilst the proposed junction arrangement put forward by ADL to mitigate the impact of Shoreham Cement Works development could cost approximately £620,000 to construct. This excludes costs related to purchase of land from Lancing Manor.

14.8.4 Therefore, the proposed junction arrangement to mitigate Shoreham Cement Works development over and above the permitted scheme could require an additional £531,213 to build when compared to the committed junction arrangement. As discussed above, this does not take into account cost related to purchase of land from Lancing Manor Estate.

14.8.5 Full details for the budget cost estimate for the committed junction improvements, and ADL's proposed junction improvements are provided as Appendix 24.7 and Appendix 24.8, respectively.

14.9 Summary and Conclusions

14.9.1 ADL have assessed each of the offsite junctions with their existing (or committed) junction arrangement in the 2033 Baseline Scenario, and with the four proposed development scenarios. The following junctions are predicted to be severely impacted by the proposed development:

- Junction 1: A283/A24 (Washington) Roundabout;
- Junction 2: A283/Water Lane/Chanctonbury Ring Road crossroads;

- Junction 4: A283/Maudlin Lane/Clays Hill/Castle Lane/The Street Roundabout;
- Junction 8: A283/A27 Slips Roundabout;
- Junction 9: A283/Upper Shoreham Road Roundabout;
- Junction 10: A283/A259 Roundabout; and
- Junction 12: A27/A2025/Manor Road (Lancing Manor) Roundabout.

14.9.2 ADL have proposed mitigation at each of these junctions to improve capacity of the junction and reduce the impact of the proposed development scenarios, compared to the 2033 Baseline Scenario with existing (or committed) junction arrangement.

14.9.3 ADL have also provided budget cost estimates for the proposed off-site highways works and these are summarised in Table 14H.

Table 14H Budget Cost Estimate Summary – Total Off Site Highway Works

Junction	Junction Name	Total Cost (inc. Contingency 10% + Optimism Bias 46%)
1	A283/A24 (Washington) Roundabout	£475,874
2	A283/Water Lane/Chanctonbury Ring Road Crossroads	£30,038**
4	A283/Maudlin Lane/Clays Hill/Castle Lane/The Street Roundabout	£70,543
8	A283/A27 Slips Roundabout	£766,912
9	A283/Upper Shoreham Road Roundabout	£118,908***
10	A283/A259 Roundabout	£84,611***
12	A27/A2025/Manor Road (Lancing Manor) Roundabout	£904,666
Including Optimism Bias (46%)		**£2,451,552**

****See paragraph 13.9.6**
*****See paragraph 13.9.7**

14.9.4 Table 14H shows that the overall costs associated with the total off-site highway works is approximately £2,451,552. This excludes cost associated with purchase of land from Lancing Manor Estate in relation to Lancing Manor Roundabout improvements.

14.9.5 WSCC confirmed that there would be no need to improve the A283/Water Lane crossroads (Junction 2) as any improvements are likely to result in an increase in rat-running along Water Lane which would not be desirable. The highway improvement contribution of £30,038 towards this junction could be put forward towards improving sustainable transport infrastructure.

14.9.6 WSCC also confirmed that they would not be looking to make any physical improvements to the urban mini roundabouts to the south of the A27 i.e. A283/Upper Shoreham Road and A283/A259. The total highway improvement contributions of £203,519 towards both these mini roundabouts could be put forward towards improving sustainable transport infrastructure in the area instead.

15.0 SUMMARY AND CONCLUSIONS

15.1 Summary

15.1.1 South Downs National Park Authority (SDNPA) are currently preparing Shoreham Cement Works Area Action Plan (AAP). The AAP will sit alongside the recently adopted South Downs Local Plan (SDLP) which covers the plan period 2014-2033.

15.1.2 Shoreham Cement Works (SCW) is allocated under Policy SD56 of the SDLP for an exemplar sustainable mixed use development, which delivers a substantially enhanced landscape and uses that are compatible with the purposes of National Park. ADL has been commissioned by SDNPA to prepare a Transport Assessment to inform the AAP.

15.1.3 This Transport Assessment assesses four proposed development scenarios against the 2033 Baseline traffic scenario. The extent of the transport study covers an approximately 18.5-kilometre length of highway, from the Washington Roundabout to the northwest of the site, to the A283/A259 junction to the south, and Lancing Manor Roundabout to the southwest. The following key junctions have been assessed:

1) A283 / A24 (Washington) Roundabout;
2) A283 / Water Lane / Chanctonbury Ring Road crossroads;
3) A283 / Maudlin Lane / Clays Hill / Castle Lane / The Street Roundabout;
4) A283 / B2135 / Horsham Road Priority Junctions;
5) A283 / A2037 Roundabout;
6) Site Access (North);
7) Site Access (South);
8) A283 / A27 Slips Roundabout;
9) A283 / Upper Shoreham Road Roundabout;
10) A283 / A259 Roundabout;
11) A27 / New Monks Farm Committed Signalised Roundabout; and
12) A27 / A2025 / Manor Road (Lancing Manor) Roundabout.

15.1.4 This TA is supplemented by four Technical Notes (TN1, TN2, TN3, and TN4) as well as extensive discussions with key stakeholders, including SDNPA, WSCC and NH.

15.2 Baseline Traffic Situation

15.2.1 WSCC provided observed traffic data for use in the Shoreham Cement Works project. These are from the National Highways A27 data collection programme in 2015 and from the Shoreham Free Wharf Transport Assessment in 2017.

15.2.2 The observed traffic flows have been upscaled to year 2033, this is the year of assessment as agreed with WSCC and NH.

15.2.3 The proposed methodology that has been accepted by WSCC is to represent committed developments and Local Plan allocations within overall growth for small to medium sites and to those that lie outside the immediate study area (i.e., beyond the area where the junction impacts are considered).

15.2.4 Therefore, except for New Monks Farm development (planning ref. AWDM/0961/17) and Shoreham Airport development (planning ref. AWDM/1093/17), other sites will be represented within overall growth. New Monks Farm and Shoreham Airport development flows have been added manually.

15.3 Proposed Development Scenarios

15.3.1 Four development scenarios have been tested to determine whether any of the scenarios in this AAP can be accommodated without any adverse traffic impact in terms of traffic capacity, sustainable travel options, road safety, key junctions or accident hot spots.

15.3.2 There are a number of land use schemes already consented within the study area which will increase residential and employment levels. The four development scenarios being potentially considered for the AAP involve a further significant increase in residential and employment levels, plus a mix of ancillary uses to maximise internalisation of trips and leisure uses.

15.4 Sustainable Transport Mitigation

15.4.1 Sustainable transport mitigation in the form of improvements to the accessibility of the site by non-car modes has been considered. The following have been put forward to reduce mode share of single occupancy car travel:

- Proposed site access to be provided with ramp access to existing underpass beneath A283;
- Underpass beneath A283 to be upgraded at per LTN 1/20 standards for pedestrians and cyclists;
- Proposed pedestrian/cyclist/horse rider linkage to Downs Link (NCN Route 223) from western portion of the site, as per LTN 1/20;
- Weather proofing of Downs Link/NCN 223;
- Improvement to NCN Route 223 A283 crossing;
- Provision of bus stops on A283 and within the site, with bus shelter, seating and Real Time Information;
- Increased frequency of Bus Route 2, to two services per hour in each direction;
- Provision of car club bays within the site; and
- Travel planning measures to promote uptake of non-car modes for residents/staff/visitors of the site.

15.4.2 Reduction in car trips within Local Plan transport studies in West Sussex was partly based on reduction factors prescribed with DfT's Sustainable Travel Towns 2010 document The Effects of Smarter Choices Programmes in Sustainable Travel Towns: Research Report (2010). However, the later study Sustainable Travel Towns: An Evaluation of The Longer-Term Impacts (2016) demonstrated that the overall reduction in traffic was far less than previously envisaged. The reasons being that promotion activities being reduced or discontinued after initial project funding ceased or increase in public transport fares.

15.4.3 Due to these reasons, it was decided that the reduction in car trips cannot be used as a first step to assess the traffic impact as this approach could result in underestimating the actual traffic impact leading to a significant funding gap for improvements in the future.

15.4.3 ADL has therefore formulated an approach whereby a package of sustainable measures could be delivered in lieu of the physical improvements to mitigate severe traffic impact at certain junctions. The construction costs to mitigate the severe traffic impact have therefore been based on worst-case scenario (i.e., no restraint to car trips) and the costs towards some junctions are then diverted towards sustainable initiatives in the areas where these junctions are located.

15.4.4 It is acknowledged that a large number of trips associated with the development proposals would be concentrated in areas such as Shoreham-by-Sea followed by Worthing and hence there is an opportunity to maximise sustainable mode share to the trips to these areas.

15.4.5 As has been agreed by WSCC, the contributions of £203,519 for the proposed highway improvements at urban junctions in Shoreham-By-Sea, i.e., A283/Upper Shoreham Road Roundabout, and A283/A259 Roundabout, could be used to allocate funding towards sustainable transport mitigation. In addition to this, the contributions of £30,038 towards improvements at A283/Water Lane junction could also be used to fund sustainable transport mitigation.

15.5 Proposed Access Arrangement

15.5.1 Several site access options from the A283 to both portions of the site have been assessed to determine a most suitable site access arrangement.

15.5.2 It is proposed to provide a four-arm roundabout on A283, at point of the existing northern access to the site. It is proposed to provide three-lane approaches on A283 north and A283 south arms of the roundabout, and two-lane approaches on east and west arms of the roundabout. This is considered the most suitable access arrangement, from a capacity perspective.

15.5.3 The junction capacity assessment is based on typical commuter peak hours and during these periods. It is considered that the likelihood of walking (and to some extent, cycling) related improvements is unlikely to tip the balance from private cars to walking (and cycling) to a material extent due to the semi-rural nature of site location and sparsity of trip-attracting destinations in the vicinity of the site. As such, junction capacity assessment has been undertaken to assume worst case scenario, for robustness.

15.6 Proposed Trip Generation

15.6.1 Vehicular trip generation exercise has been undertaken which establishes the following two-way peak hour trip levels:

Proposed Development Scenario 1:

- AM Peak Hour: 570
- PM Peak Hour: 542

Proposed Development Scenario 2:

- AM Peak Hour: 488
- PM Peak Hour: 465

Proposed Development Scenario 3:

- AM Peak Hour: 325
- PM Peak Hour: 417

Proposed Development Scenario 4:

- AM Peak Hour: 385
- PM Peak Hour: 350

15.6.2 These development vehicular trips are likely to impact a number of junctions within the study area. The suggested mitigation measures are:

Junction 1: Washington Roundabout:

- A283 West arm – increase entry width, with lane direction road markings;
- A24 North arm – increase entry width, with lane direction road markings – left lane dedicated to left turners, two lanes dedicated for straight ahead and right/U-turners;
- A283 East arm – lane direction road markings;
- A24 South arm – lane direction road markings; and

- Circulatory lane direction road markings

Junction 2: A283 / Water Lane Crossroads

- Water Lane – increase width to 6.0 metres at 10 metres back from give-way, and up to 5.5 metres at 15 metre back from give-way; and
- Increase visibility to left onto A283 to 100 metres – WSCC to maintain the vegetation within adopted highway extent.

Junction 4: A283/Clays Hill Roundabout:

- A283 South arm – increase entry width

Junction 8: A283/A27 Slips Roundabout:

- Westbound Slips arm – increase entry width, dedicated left hand lane for A283 South traffic, and lane direction road markings;
- A283 South arm – increase entry width, dedicated left hand lane for A283 North traffic; and lane direction road markings;
- A283 North arm – increase entry width, dedicated left hand lane for A27 eastbound traffic; and lane direction road markings;
- A27 Eastbound Slips arm – increase entry width, dedicated left hand lane for A27 Westbound traffic and lane direction road markings; and
- Circulatory lanes – increase from two lanes to three lanes.

Junction 9: A283/Upper Shoreham Road Roundabout:

- A283 South arm – increase entry width by realigning the western kerbline within adopted highway,
- A283 North arm – increase entry width by realigning the northeastern kerbline, and amending the splitter island.
- Increase distance between arms (i.e., increase size of roundabout):

Junction 10: A283/A259 Roundabout:

- Increase size of roundabout from ICD of 26 metres to ICD of 28.5 metres; and
- Give way lines for A259 West and A283 arms of roundabout moved back, making sure visibilities work;

Junction 12: Lancing Manor Roundabout:

- Increase size of roundabout to ICD of 60 metres;
- Circulatory lanes broadly as per committed arrangement, with additional road markings and directional arrows;
- A27 East arm – increase entry width;
- A2025 Grinstead Lane arm – increase entry width;
- A27 West arm – increase entry width
- Manor Road arm – increase approach road half width and increase entry width

15.6.3 The measures tested improve the theoretical capacity of the junctions listed above to give a significant improvement in the individual junction performance and the journey times along key routes through the study area. It is therefore concluded that the mitigation tested is generally sufficient to accommodate the increased traffic associated with all of the development scenarios examined.

15.6.4 The overall costs associated with the off-site highway works is approximately £2,451,552. This excludes cost associated with purchase of land from Lancing Manor Estate in relation to Lancing Manor Roundabout improvements.

15.6.5 As mentioned previously, Junction 1 may not require any mitigation should Highway Authority consider that the increase in queues as a result of the development scenarios does not warrant any improvements.

15.6.6 WSCC confirmed that there would be no need to improve the A283/Water Lane crossroads (Junction 2) as any improvements are likely to result in an increase in rat-running along Water Lane which would not be desirable.

15.6.7 WSCC also confirmed that they would not be looking to make any physical improvements to the urban mini roundabouts to the south of the A27 i.e. A283/Upper Shoreham Road and A283/A259. The total highway improvement contributions of £203,519 towards both these mini roundabouts could be put forward towards improving sustainable transport infrastructure in the area instead.

15.6.8 The proposed improvements to A283/A27 Slips Roundabout and A27/Grinstead Lane (Lancing Manor) Roundabout have been scrutinised using DMRB's CD 116 Geometric Design of Roundabouts compliance checklist. It is summarised that the improvements meet CD 116 requirement for the majority of the parameters. For others, it is demonstrated that there would not be worsening of the junction safety when compared to the existing situation for A283/A27 Slips Roundabout, and to the permitted NMF's scheme for A27/Grinstead Lane Roundabout.

15.6.9 Overall, the conclusion of this study is that delivery of the proposed development scenarios is feasible from a transport perspective, but this will require significant highway improvement measures coupled with reduction in private car mode share.

APPENDIX 1.0

STAKEHOLDER ENGAGEMENT

TRAFFIC & HIGHWAYS ENGINEERING LIMITED

NOTE OF MEETING

Subject:	Shoreham Cement Works, Shoreham – Inception Meeting		
Location:	MS Teams		
Date:	14 July 2021	Time:	10:00 – 11:45
ADL Ref:	5201		

In Attendance:

Lucy Howard (LH)	-	South Downs NP
Alex Pringle (AP)	-	South Downs NP
Kevin Bown (KB)	-	Highways England
Derek Jones (DJ)	-	Highways England
Olamide Olayinka (OO)	-	West Sussex CC
Guy Parfect (GP)	-	West Sussex CC
Amol Pisal (ADP)	-	ADL Traffic
Andy Miles (AM)	-	ADL Traffic
Alex Painting (AEP)	-	ADL Traffic

Introduction to Project, SDNPA Objectives and Timescales

- LH - Shoreham huge potential for years and years.
- LH - Personal duty – conserve and enhance landscape – redevelop to regenerate to heal the scar on the landscape (first purpose)
- LH - Socio-economic – pursuant to purposes – regeneration with new development will heal.
- LH - Site allocated in Local Plan – high level policy
- LH -Commissioned transport study / other work heritage/biodiversity/contamination to support consultation beginning 2022.
- LH - All studies to talk to each other – coordinate – be flexible.
- Lucy Howard overall manager – AP go to for questions. Guy / Olamide – Technical Support.

The site

- LH -Brownfield site with extant permission that extends – 'Permission to do all sorts of things on the site?' Details in the Local Plan – High Level Policy – AAP to drill down and find the details and types and parameters of any planning application.
- ADP asked – for areas of existing buildings.
- LH – to provide areas for buildings.
- AP – advised that topo survey available. AP and LH to find this.

APPENDIX 1.1
NOTES OF MEETING:
INCEPTION MEETING

- KB – agrees that finding an agreed baseline use / traffic generation etc. Cannot claim existing use from multiple years ago, being a brownfield site – What is the traffic in reality?
- GP – 5 years as rule of thumb as permitted activity. If not within 5 years – disregard.
- GP – planning history to be picked up / reviewed? If accounting for some existing B2 use – legitimate but find most appropriate trip rate.
- KB – Same with Sui Generis. Certificates / Enforcement action from Council? What are commitments for this site?
- AP – Design and mitigation work – few guidance and policy docs – "Roads in the South Downs" provides opinions and approaches to highway design and associated furniture and clutter – items such as dark sky reserve (to be aware of).
- KB – Speed limit of A283?
- ADP – National Speed Limit. Proposing to undertake ATC surveys on the road to determine 85th percentile speeds.

Mobilisation, Data Collection

- GP – MOBILISATION – question for ADL? What do you need? How quickly can you get going?
- AP – School holidays soon. Surveys asap on two junctions. West Sussex how long to provide license agreement? Fast-track?
- GP – to contact colleague re: data collection. Attach to lamppost will take longer for license.
- DJ – Written scoping note to be provided?
- ADP – Hope bid document sufficient for scoping, however a formal scoping note can be provided.
- GP – methodology note would be required.
- AP – chat with South Downs to give HE sight of the bid document?
- ADP – can make start on reviewing / determining permitted and proposed traffic generation. Will use census data to determine trip distribution / compare against existing Council O-D data (2015).
- GP – 2015 O-D data may need formatting to be readable. Trip generation from zones, older strategic models – too old 10-12 years old? Census - High survey value but only covers one journey purpose – commuting higher average trip length than other journey purposes. Useful to use as proxy. Asked Kevin or other?
- AP – Additional weighting to leisure trips? Gateway entry points to a number of sites.
- KB – Combination of sources and see what it starts to tell us. New Monks Farm TA modelling would assist? Any other applications to provide trip distribution. Look at both ends.
- LH – Ikea withdrawn from New Monks Farm. BHCC own the site. – Please look at all modelling but be flexible due to other uses going in there.
- GP – advised New Monks Farm planning application. Have a look at the TA for that site – more general trip rates for consented A1 retail use to be established.

Trip Distribution

- GP – strategic models for longer distance routeing. HE look at sample routing from their strategic modelling and compare notes as HE's modelling in the area more up-to-date; although not suitable for direct use due to 3-hr peak period. But it is suitable for route choice for longer distance routes.
- GP – Going North – via A24 or A2037 or A23
- GP - Going East – most will be joining Shoreham Bypass; unless they are going to local destinations (such as Shoreham Harbour or Shoreham Town Centre) in which case, they would continue along the A283.
- GP - Going West (to Lancing / Worthing etc) will be using A27 despite congestion issues. Element relatively small, traffic going further afield - A27 through Worthing or A283 via Washington / Storrington down toward A27 using B-road through Amberley join A29 at Fontwell.
- GP – we can look at turning movements from previous turning movements / models etc for local destinations
- KB – to find out existing models in the locality.
- GP – model for last Lancing / Worthing improvement forecast modelling. Cavaet – covering average of 3 hour period – not same as peak but overall route choice okay.
- KB – Modelling – exchange of emails on what GP has, how recent, how useful. KB to do likewise. To form a model or spreadsheet composite model?
- ADP – when would the information be given to us.
- GP – to send email today and copy team.
- KB – to get hold of Nigel – know what data / models available next couple days.

Forecasting

- GP – Forecasting – New Monks Farm - In-principle assume A1 use, but not same trip rates used for Ikea. Forecast models that CC have will include the Adur local plan allocations under Shoreham Harbour joint AAP allocations. These are broadly right for commitment for housing in New Monks Farm. Office/employment development at Shoreham Airport has not come forward in detail yet. Housing at West Sompting which has been going through but has stuck in light of local plan allocation. Shoreham Harbour require a bit more investigation to check how consents have been developing through there in comparison to strategic modelling. HE's Worthing/Lancing modelling runs more up-to-date (same caveat as before i.e. 3-hr period).
- GP – will source committed developments from relevant local authorities. Other council committed developments from Adur & Worthing, Shoreham Harbour too, Horsham District Council – check for anything big? Share forecasting uncertainty log.
- ADP – Requested list of all relevant committed developments. What assumptions made within strategic model for Shoreham Cement Works?

- GP – Check uncertainty log to see what that says.
- GP – Overall levels of flows – dealing with one site rather than Local Plan – applying background growth? To avoid double counting.
- KB – If stuff realistically allocated, then use then use allocations rather than TEMPRO. Compare and contrast. May need to use TEMPRO if Local Plan not relevant – may require hybrid approach. Distribution of development unlikely to be too different to local plan.
- GP – for strategic modelling – comparison to development case should be more of less right for everything. Subject to any information what has been happening within Shoreham Harbour – key differences? Types of residential development. Overall forecast traffic flows – 2031 flows growthed from 2009 base? Warranted additional note comparing forecasted v surveyed.
- GP – if using forecasting models of different ages – compare to fixed strategic counts.
- KB – awaiting advice on when surveys can start. Kent CC to listen to surveys from Sept.
- GP – West Sussex to start surveys from September. Keep close eye on long-term monitoring for trends. SDNPA first approached GP, first question – can we wait till September? Couple surveys required before school holidays due to timescales – keep an eye on trends. See how measure up and re-do surveys later if required? Do what we can now, and finesses in few months if required.
- Bank holiday (BH) traffic? More peaky than average weekday peak? A283 seasonal – north-south routes through Downs. Holiday days will be busy days. Sensitivity?
- KB – Sensor out / ATC to determine BH / Holiday traffic? Continuous site A283 between site and A27. Discern BH traffic variation?
- GP – to look and decide if any existing information exists?

Capacity assessments for junctions/links/surveys

- DP – How will capacity assessments undertaken?
- Amol – Criteria proposed to use – increase in link by 30 two-way trips or 5% of baseline traffic, that junction will qualify for capacity assessment. Use standalone assessment using PICADY/ARCADY/LINSIG dependent on junction.
- DJ – 30 or more peak hour trips at junction better rather than percentage.
- KB – Focus more on queue length / delay / loss of service. More pragmatic approach – dependent on existing issues / safety history etc. Can add traffic and make it safer or less safe. Not simplistic – use local knowledge to interpret and judge whether capacity assessment is required.
- Amol – Criteria suggested starting point. Then assess case by case.
- GP – Roundabout under A27 Flyover / got mitigation associated already. Gathering funding / implementing. Include committed highway improvements / mitigation. New Monks Road / Shoreham Airport access roundabout? Local Plan mitigation (minor) for North Lancing roundabout A27. Key junction – existing congestion. Look at Merge / Diverge on to main line. A283 roundabout Shoreham High Street. What proportion of traffic reach? More sustainable transport – not physical improvements.

A283/A24 roundabout at Washington congestion – key strategic – peak time congestion. Northbound AM / Southbound PM. Lesser extent on east/west arms. Horsham District Council local plan review – investigating improvements. 4th Arm of the Junction Design will need to model future flows and the impact of the SCWs, signalised for motorists and pedestrians with LINSIG.

Road Safety

- GP – Road Safety – requirement in guidance – show no unacceptable impact on road safety. Look at existing accident history – look at 5-year period. Road Safety team to supply data. State working for Council to avoid fees and be prioritized. Specify period and scope – should cover the junctions mentioned.
- KB - Review one junction either side of A283 junction. Other side of constrained junction at Southlands.
- GP – development only has to mitigate own impact. Need to prevent exasperating of hot spot collisions etc. Correlate where key locations are for road safety or above average accident rates along links – correlated with where traffic increase is.

Air Quality

- GP – Air Quality – AQMA Shoreham High Street to bear in mind. Do not assess AQ but need sufficient outputs that other people working from NP can assess if any implications for AQ.
- ADP – Assume need AADT / % HGV's along High Street.

Mitigation strategy

- GP – MITIGATION – to comply with local and national policy. Sustainable transport first. Existing cycle path – Shoreham Downs? Existing bus route. Realistic constraints, but working within that. How to use existing facilities – what viable long-term in future improvements. Combination of hard and soft measures? After that, look at highway mitigation.
- KB – Typical sustainable transport starting point. Base it on worst-case scenario. Other end of scale, optimistic. Within that range. Location of site – attractive for car-borne traffic. Depends on build-out profile. Over many years – monitor and manage framework. Set in reviews – worst case, review further down the line.
- ADP – development scenarios. Two site accesses – would like consider potential upgrade of site accesses and potential speed limit reduction within vicinity? Crossing facilities? NSL therefore not appropriate.
- AP – Some speed limit reduction to 40/50mph possible.

- GP – Speed limit policy to send to ADL. Sets out how look at speed limits. Principle – cannot make new dev dependent on TRO. Consider benefits – Open site, and then bring something forward. Cannot have something undeliverable if TRO fails.
- LH – Interesting idea re: improvements to access. Impact on viability due to extra cost?
- LH – South Downs Way national trail. Priority purpose to be considered.
- GP – South Downs Way take a lot of commuter trips.
- AP – Consult with bus companies – improvements to real-time tracking.
- ADP – To suggest improvements to existing bus stops.

Design & costing principles

- GP – Assured that mitigation package is affordable and deliverable. Scope out various sustainable transport measures are likely to cost. Including softer measures and subsidies. Hard infrastructure on crossing links and off-site junction improvements. Design level that is sufficiently a robust cost that will not increase and affect viability.
- KB – Base everything on preliminary design. Costed. Demonstrated how to be funded. Levelling up? Grampian conditions until mitigations are in place?
- GP – Design well enough considered to know what land is required. 3rd party lane, a new level of work.
- ADP – Adopted highway extents / ordnance survey mapping to be provided by the Council?
- GP – Carol Rigler Land Charges to provide the information.
- KB – to provide extracts from GIS re: HE land.
- AP / GP – to review GIS for OS CAD data.
- AP – Design principles – DMRB? Accessing site – keep eye on MfS / MfS2.
- GP – can't have whole proposal dependent on TRO amendment. Initial phase – before speed limit reduction. Ultimate layout – assuming speed limit reduction deliverable.
- LH – Conserve / enhance – landscape. All highway design to be mindful.

Project Management

- Project Management – AP to be key contact for South Down NP. GP direct contact at West Sussex (cc AP). Call follow up with email.

Communication

- AP – Communication – timescales? 2 weeks between each note indicative in timescales?
- ADP – ADL team to put together to-do list. Technical Note 1 to follow 2 weeks from now. Constant communication with progress updates in the interim.
- LH – Over Summer to get dates in diaries.

- Amol – to provide dates for potential meetings / updates.
- KB – agree scoping methodology, and outcomes. Due course – mitigations. Keep HE in loop re: meetings in diaries, how things are progressing and whether need to chip in.

Stakeholders

- AP – primary stakeholders – SDNPA, WSCC and HE – outline updates at Adur
- LH – will be sharing Adur and Worthing, and Horsham.
- GP – Stakeholders - Other neighbouring authorities? Adur and Worthing. Western end Brighton Hove/ and southern end of Horsham?
- GP – Arun preparing for next Local Plan review. Number of permitted sites coming forward from Arun.
- ADP – prefer to communicate to the local authorities via AP.
- LH – AP to introduce ADL to officers at neighbouring authorities.
- GP – a lot of adjacent authorities should have planning information available.
- KB – normal response target 21 days. Will try meet 14 days turnaround.

TRAFFIC & HIGHWAYS ENGINEERING LIMITED

NOTES OF MEETING

Subject:	Shoreham Cement Works – Discussion on ADL Technical Note 1		
Location:	MS Teams		
Date:	05/08/2021	Time:	11:00
ADL Ref:	5201		

In Attendance:

SDNPA	-	Alex Pringle (AP)
WSCC	-	Guy Parfect (GP)
WSCC	-	Olamide Olayinka (OO)
ADL	-	Amol Pisal (ADP)
ADL	-	Alex Painting (AEP)
ADL	-	Andy Miles (AM)

Trip Distribution:

- TA from Monks Farm and Shoreham Airport - Trip distribution based on census travel to work, both major schemes - HE and council accepted the methodology.
- WSCC think availability of MND, 4 years newer than 2011 Census data, data directly relates to range of trip purposes associated with the site should be used as well.
- Agreed to use a mixture of 2011 Census Travel to Work data and MND.
- AP discussed the Census/MND combination to be used for residential and employment as per AP's email of 5th August 2021.
- GP advised that the % splits appeared appropriate.
    - AP advised that for school, external inbound trips would be based on the MND OB_HBO and external outbound trips would be based on the MND IB_HBO
    - For hotel, the trip distribution would be based on NHB
- All convenience store trips to be internal, servicing trips to be negligible / outside of peak hours.
- Using Google Maps data – speak of limitations/uncertainty of this data in reports.

Permitted Trip Generation:

- Use commercial warehouse for mobile home use for existing.

Proposed Trip Generation:

- For hotel, to remove edge of town centre / town centre sites – update in Technical Note 1.
- Need to know number rooms / GFA – AP to chase for further information.
- ADP explained that Friday survey dates within TRICS assessment will not be excluded in both permitted and proposed trip generation.

Traffic Data:

- Missing traffic counts on A283 to north of SCW site – GP has asked Horsham District Council for this (2019 data)

APPENDIX 1.2
NOTES OF MEETING:
TECHNICAL NOTE 1

- Missing traffic counts to south of A27 (Shoreham) – to use data from Shoreham Free Wharf TA (2017) or model flows for any remaining missing junctions – GP to provide.
- Missing traffic counts along the A27 – GP to supply the 2015 data from the HE.

Committed Development:

- To use Wiston Estate Winery development. At the Washington Roundabout, the flows to be distributed in accordance with the turning proportion from the survey.
- Other committed developments – the trip distribution on the critical junctions to be based on Census/MND is possible and further on to be distributed using turning proportion.
- New Monks Farm – use nonfood retail trip generations

TECHNICAL NOTE 1 (REV A)
TRANSPORT ASSESSMENT METHODOLOGY
SHOREHAM CEMENT WORKS
SOUTH DOWNS NATIONAL PARK AUTHORITY
(ADL REF: 5201, 19th AUGUST 2021)

1.0 INTRODUCTION

1.1 ADL Traffic & Highways Engineering Ltd have been commissioned by South Downs National Park Authority (SDNPA) to undertake a transport study of the development scenarios at Shoreham Cement Works.

1.2 A meeting was held with SDNPA and WSCC on 5th August 2021 to discuss trip generation, distributing and assignment methodology. This Technical Note 1 (TN1) Revision A provides an approach agreed with SDNPA and WSCC.

1.3 Following salient items pertinent to this note were discussed and agreed with SDNPA and WSCC:

- Trip distribution to be based on Census/Mobile Network data (MND) combination.
- Using Google Maps for routeing/assignment purposes, but including caveat that the assignment may need to be re-checked later in autumn to see if there have been any significant changes.
- Trip generation for existing mobile home businesses on site to be based on commercial warehousing sites in TRICS (and not car showroom).
- Trip generation for hotels to exclude town centre and suburban sites in TRICS.
- Friday survey dates within TRICS assessment considered to be acceptable given that Friday survey dates have been used for both permitted and proposed trip generation.

ADL House, Oaklands Business Park, Armstrong Way, Yate, Bristol BS37 5NA | Tel: 01454 332 100 | Email: info@adltraffic.co.uk | Web: www.adltraffic.co.uk
Company No. 3121125 | VAT Registration No. 674 4017 36

2.0 PERMITTED TRIP GENERATION

2.1 SDNPA's Major Projects Head has provided the following information regarding existing permitted uses on site that have been active during the last five years.

Main Cement works site

Importation, storage and treatment if inept material to produce recycled/secondary aggregate. Site area = 6.23 hectares. 50,000 tonnes per annum between hours 07:00 and 18:00 weekdays and 07:00 and 13:00 Saturdays. Maximum daily movements = 100 HGVs but may be as low as 10.

Uses on the west side of A283

Vehicle repair, coach and bus parking, scrap recycling, scaffold storage etc. Use Classes B1, B2 and B8 including residential security, caravan. 30 businesses employing 150 people. Site are = 3.45 hectares

2.2 Based on the information provided by SDNPA, the cement works site (east of the A283) generates a maximum of 100 HGV movements (i.e., 50 inbound and 50 outbound) on a weekday. Typical peak hour trips (AM and PM peak hours) equate to 10% of the daily trips.

2.3 Therefore, the cement works site would generate 10 HGV movements (i.e., 5 inbound and 5 outbound) during AM (08:00 – 09:00) and PM (17:00 – 18:00) peak hours.

2.4 With regards to the part of the site to the west of the A283, planning permission SDNP/20/00110/CND was granted on 6th July 2020 which would allow the site to be used for purposes falling with use classes B1, B2 and B8 (business, industry and storage) until 31st January 2025.

2.5 It is noted that there are 30 businesses on this part of the site. The list of these businesses was included as part of the 2015/15 planning application. These are provided in Table 2A.

Table 2A Occupants of the site to the west of A283

PLAN REF	PARCEL DESCRIPTION	OCCUPIER NAME	NATURE OF BUSINESS	DESCRIPTION OF USE/ACTIVITIES	AREA (SQM)
1	Container & Hardstanding #27	Peter Taylor	Vehicle recovery	Hardstanding for vehicle storage and a container for the storage of inate material	444
2	Garage Bays 1 & 2	Martin Memory	Mechanic	Garage bay for vehicle repair and adjoining area for vehicle parking	150
3	Garage Bay 3	Vantech Sussex Limited - Chris Carpenter	Mechanic	Garage bay for vehicle repair and adjoining area for vehicle parking	75
4	Garage Bay 4	Vantech Sussex Limited - Chris Carpenter	Mechanic	Garage bay for vehicle repair and adjoining area for vehicle parking	75
5	Garage Bay 5	Ace Travel Ltd	Coach operator	Garage bay for vehicle repair and adjoining area for vehicle parking	75
6	Garage Bay 6 & Container 5	Brightonian & Ocean Coaches - Peter Woodcock	Coach operator	Garage bay for vehicle repair and a container for the storage of inate material	194
7	Garage Bay 7	Heritage Travel	Coach operator	Garage bay for vehicle repair and adjoining area for vehicle parking	75
8	Garage Bay 8	Neil Bird t/a Southern Transit	Bus & coach operator	Garage bay for vehicle repair and adjoining area for vehicle parking	75
9	Hardstanding #1	Vantech Sussex Limited – Chris Carpenter	Mechanic	Hardstanding for coach parking/storage	525
10	Hardstanding #2	Heritage Travel - as 7 (same lease)	Coach operator	Hardstanding for vehicle parking/storage	640
11	Hardstanding #3	C Jenkin & Son	Mobile Home dealer	Hardstanding for mobile home storage	1193
12	Hardstanding #4	Neil Bird t/a Southern Transit	Bus & coach operator	Hardstanding for bus & coach parking/storage	1139
13	Hardstanding #5	Crawley Luxury Coaches - Dave Brown	Coach operator	Hardstanding for coach parking/storage	76
14	Hardstanding #7	Jason Hodge	Scrap/recycling operator	Enclosed yard for the storage of recycliable material	1132
15	Hardstanding #9	S. Holman & C. English	storage of coaches	Hardstanding for coach parking/storage	410
16	Hardstanding #10A & B	J Messham	storage of equipment	storage of Wall of Death equipment	1252
17	Hardstanding #12	Neil Bird t/a Southern Transit	Bus & coach operator	Hardstanding for bus & coach parking/storage	197
18	Hardstanding #13	David Savage	Scrap/recycling operator	Hardstanding for vehicle parking/storage and storage of a boat	49
19	Hardstanding #15	Dave Hunt t/a DSH Leisure	Fairground ride operator	Hardstanding for fairground rides	496
20	Hardstanding #17	Ryan Cunningham	Car storage	Yard and building for paving slab and vehicle storage	207
21	Hardstanding #18	C Jenkin & Son	Mobile Home dealer	Hardstanding for mobile home storage	2009
22	Hardstanding #21	Nigel Crickmore	Vehicle recovery	Hardstanding for vehicle parking/storage	87
23	Hardstanding #22	Steven Wright	Scrap/recycling operator	Hardstanding for vehicle parking/storage	80
24	Hardstanding #23	Avery Howell & Oliver Glover	Vehicle recovery	Hardstanding for vehicle parking/storage	342
25	Hardstanding #25	Neil Bird t/a Southern Transit	Bus & coach operator	Hardstanding for bus & coach parking/storage	634
26	Hardstanding #28	Kristian Dutton	Scrap/reclamation operator	Hardstanding for vehicle parking/storage and an office for associated uses	603
27	Loading Bay	Philip Malkin	Vehicle storage	Yard and building for vehicle storage	410
28	Loco Shed	Ace Travel Ltd	Coach operator	Garage bay for vehicle repair and adjoining hardstanding for vehicle parking	384
29	Packing Plant	Scaffold It (UK) Limited	Scaffolding Company	Yard and building for scaffold storage	917
30	Hardstanding #10C	DC Geoghegen Ltd	Builders	Storage of building materials & skips	

2.6 Table 2A shows that 1,698 sqm area is occupied by vehicle recovery and repair businesses, 8,970 sqm area is used for vehicle storage (cars/coaches/buses), including by mobile home sales company and, 2,781 sqm is occupied by general industrial units. This matches well within the information provided by SDNPA's Major Projects Head (see paragraph 2.1).

2.7 For the purpose of estimating trip generation, vehicle repair garages, commercial warehousing and industrial units are the sub-land uses within TRICS would be chosen. The TRICS reports are provided as Appendices 1.1 to 1.3 respectively. The weekday peak hour trip rates and vehicular trips is provided in Table 2B.

Table 2B Permitted Development to West of A283

		Trip Rate per 100sqm		Vehicle Trips		
		In	Out	In	Out	2-way
Vehicle Repair Garages	08:00-09:00 17:00-18:00	1.220 0.530	0.670 0.850	27 9	11 14	38 23
Commercial Warehousing	08:00-09:00 17:00-18:00	0.217 0.078	0.097 0.224	19 7	9 20	28 27
Industrial Unit	08:00-09:00 17:00-18:00	0.509 0.044	0.087 0.479	14 1	2 13	16 14
Total	**08:00-09:00** **17:00-18:00**			**60** **17**	**22** **47**	**82** **64**

2.8 The total permitted vehicular trip generation associated with the entire site is provided in Table 2C.

Table 2C Total Permitted Vehicular Trip Generation

		In	Out	Two-way
Cement Works Site	08:00-09:00 17:00-18:00	5 5	5 5	10 10
West of A283	08:00-09:00 17:00-18:00	60 17	22 47	82 64
Total	**08:00-09:00** **17:00-18:00**	**65** **22**	**27** **52**	**92** **74**

2.9 Table 2C shows that the overall permitted vehicular trip generation associated with the entire site is estimated to be 92 and 74 two-way vehicular movements during AM and PM peak hours, respectively.

3.0 PROPOSED TRIP GENERATION

3.1 The development scenarios that would be considered as part of the transport study as per ITT are provided in Tables 3A and 3B for eastern and western parts of the site respectively. It is agreed with SDNPA that the non-residential development would take place on the east of the A283. The split of residential element (i.e. east and west of the A283) is as per the projects ITT.

Table 3A Development Scenarios – East of A283

	Scenario A	Scenario B	Scenario C
Dwellings	150	90	10
A1 (sqm)	200	200	200
D1 (sqm)	2,000	2,000	0
B1 (b/c) (sqm)	32,000	32,000	0
B2 (sqm)	16,200	16,200	0
D2 (sqm)	0	0	18,500
C1 (sqm)	7,500	7,500	37,000
B8 (sqm)	20,000	20,000	0

Table 3B Development Scenario – West of A283

	Scenario A	Scenario B	Scenario C
Dwelling	250	150	100

3.2 TRICS has been used to estimate trip generation associated with the aforementioned land uses. The site selection criteria used within TRICS is as follows:

Dwellings (Use Class C3)

- Main land use – Residential
- Sub land use – Houses privately owned
- Multi-modal surveys
- Regions – England (excl. London), Wales, Scotland
- № of dwellings – between 60 and 600 units
- Location – edge of town
- Sites with Travel Plan excluded
- Sites which contain flats excluded, as flats typically have lower car ownership

Primary School (Use Class D1 New Use Class F1)

- Main land use – Education
- Sub land use – Primary
- Multi-modal survey

- Regions – England (excl. London), Wales, Scotland
- Area – between 1,000sqm and 3,000sqm (+/-50% of people)
- Location – Suburban (edge of town sites not available)
- Sites with Travel Plans excluded

Convenience Store (Use Class A1, New Use Class E)

- Main Land use – Retail
- Sub Lane use – Convenience store
- Multi-modal surveys
- Regions – England (excl. London), Wales, Scotland
- Area – between 100sqm and 300sqm (+/- 50% of proposed area)
- Location – Suburban (edge of town sites not available)

R&D/Light Industrial/Storage & Distribution (Use Class B1(b/c), B2, B8)

- Main Land use – Employment
- Sub Land use – Industrial estate
- Multi-modal surveys
- Region – England (excl. London), Wales, Scotland
- Location – Edge of town
- Sites which do not contain any of the B1/B2/B8 excluded

Hotel (Use Class C1)

- Main Land use – Hotel, Food and Drink
- Sub Land use – Hotels
- Multi-modal surveys
- Region – England (excl. London), Wales, Scotland
- Location – Edge of town

3.3 TRICS reports are provided in Appendix 2.1 to 2.5 respectively and the trip rates based on those site selection criteria within TRICS database is provided in Tables 3C to 3G.

Table 3C Residential Trip Rates

	Peak Hour	Trip Rates per Unit		
		In	Out	Two-way
Vehicles	08:00-09:00	0.125	0.385	0.510

4.0 INTERNALISED TRIPS

4.1 Primary School Trips

4.1.1 Some of the trips associated with the primary school would originate internally from the proposed residential element.

4.1.2 In order to determine the number of internalised trips associated with the school, following information has been sought by using combination of 2011 Census and TRICS:

- № of people living within the development
- № of primary school age children living within the development
- Total capacity of proposed primary school.

4.1.3 Based on 2011 Census:

- № of dwellings within West Sussex = 345,614
- Population of West Sussex = 806,892
- Population of primary school aged children = 135,398

4.1.4 Using this information, following has been calculated by way of proportioning:

Development scenario A (400 homes)

- № of people living within development = 934
- № of primary school aged children living within development = **157**

Development scenario B (240 homes)

- № of people living within development = 560
- № of primary school aged children living within development = **94**

Development scenario C (110 homes)

- № of people living within development = 257
- № of primary school aged children living within development = 43

4.1.5 Using the school sites within TRICS database which were used for trip generation, a ratio of 1 pupil to 6 sqm of school area is obtained. Therefore, proposed school area of 2,000 sqm would have a capacity to accommodate 2000 ÷ 6 = 333 pupils.

4.1.6 Therefore, in Development Scenario A, out of 333 pupils studying in the proposed school, 333 – 157 = 176 pupils would travel from nearby areas such as Upper Beeding and Steyning.

4.1.7 In Development Scenario B, out of 333 pupils studying in the proposed school, 333 – 94 = 239 pupils would travel from nearby areas such as Upper Beeding and Steyning.

4.1.8 There is no school within Development Scenario C.

4.2 Employment Trips

4.2.1 The site is located within Super Output Area (SOA) E02006603. 2011 Census data reveals that out of 899 people that travelled to this SOA to work, 170 also lived in this SOA i.e., 19%.

4.2.2 Therefore, further purposes of assessment, 19% of the residential trips would be internal trips associated with the proposed employment uses.

4.3 Convenience Store Trips

4.3.1 The proposed convenience store would be a local facility predominantly used by the residents and staff living and working within the development. During peak hours, there is unlikely to be any external trips or servicing trips that would be generated by this convenience store. This is agreed with SDNPA and WSCC at the meeting on 5th August 2021.

5.0 TRIP DISTRIBUTION AND ASSIGNMENT

5.1 ADL have reviewed the Joint Transport Assessment (TA) prepared in support of New Monks Farm and Shoreham Airport developments by Vectos.

5.2 New Monks Farm development comprised 600 residential dwellings, an Ikea store, a Country Park, primary school, relocated and expanded Withy Patch Gypsy and Traveller site and associated infrastructure.

5.3 Shoreham Airport development comprised 25,000sqm of industrial/warehousing development.

5.4 Vectos TA distributed the residential trips using Census 2011 O-D dataset. This approach was approved by the Highway Authority.

5.5 Ikea trips were distributed based on Census 2011 super Output areas and consideration of overlapping catchments with other Ikea stores.

5.6 Shoreham Airport development trips were also distributed based on 2011 Census O-D dataset.

5.7 All the residents and employment trips were assigned on to the local road network using web-based journey planning tools.

5.8 ADL proposed the exact methodology within the bid document.

5.9 Following the meeting with SDNPA and WSCC on 5th August 2021, it was agreed that whilst the census is the best source for travel to work trips, the mobile Network Data (MND) is the best source for distribution of other trip purposes.

5.10 For residential trips, appropriate split for Census desired journey to work trips and MND desired home-based trips (HBO) would be used as advised by WSCC.

5.11 For employment trips, appropriate split for Census desired journey to work trips and MND desired other trips (NHB) would be used as advised by WSCC.

5.12 For school external trips, the distribution based on MND would be used.

5.13 For hotel trip distribution, MND desired NHB trips would be used.

5.14 Trip distribution has been based following areas with Census and MND:-

Residential

- Horsham 016A to 016E (Middle Super Output Areas (MSOA)

Employment

- Adur 007A (MSOA)

5.15 Based on the agreed trip distribution methodology, trip distribution split between Census and MND for residential and employment elements are provided in Table 5A and 5B.

Table 5A Residential Trip Distribution Split

	In		Out	
	Census HBW	**MND HBO**	**Census HBW**	**MND HBO**
AM Peak Hours	4%	96%	58%	42%
PM Peak Hours	52%	48%	0%	100%

Table 5B Employment Trip Distribution Split

	In		Out	
	Census HBW	**MND NHB**	**Census HBW**	**MND NHB**
AM Peak Hours	69%	31%	0%	100%
PM Peak Hours	3%	97%	53%	47%

5.16 Given that the strategic transport models are not considered to be appropriate for the use for this study, due to various deficiencies on the A27 within Worthing Model and Shoreham Harbour Model being based on 2009 data. Trip assignment/routeing will therefore be based upon Google Maps as agreed with SDNPA and WSCC. It is acknowledged that Google map routeing is based on current travel levels which are affected by COVID restrictions. Hence, further checks would need to undertake in autumn to determine if there have been any significant changes.

APPENDIX 1.0

TRICS: PERMITTED

1.1 Vehicle Repair Garage
1.2 Commercial Warehousing
1.3 Industrial Unit

Calculation Reference: AUDIT-733701-210725-0756

TRIP RATE CALCULATION SELECTION PARAMETERS:

Land Use : 15 - VEHICLE SERVICES
Category : A - VEHICLE REPAIR GARAGE (SLOW FIT)
TOTAL VEHICLES

Selected regions and areas:

02	SOUTH EAST		
	HF	HERTFORDSHIRE	1 days
04	EAST ANGLIA		
	CA	CAMBRIDGESHIRE	1 days
05	EAST MIDLANDS		
	LE	LEICESTERSHIRE	2 days
	LN	LINCOLNSHIRE	1 days
06	WEST MIDLANDS		
	WO	WORCESTERSHIRE	1 days
07	YORKSHIRE & NORTH LINCOLNSHIRE		
	WY	WEST YORKSHIRE	1 days
09	NORTH		
	TW	TYNE & WEAR	1 days

This section displays the number of survey days per TRICS® sub-region in the selected set

Primary Filtering selection:

This data displays the chosen trip rate parameter and its selected range. Only sites that fall within the parameter range are included in the trip rate calculation.

Parameter: Gross floor area
Actual Range: 290 to 5100 (units: sqm)
Range Selected by User: 136 to 5100 (units: sqm)

Parking Spaces Range: All Surveys Included

Public Transport Provision:
Selection by: Include all surveys

Date Range: 01/01/00 to 28/06/19

This data displays the range of survey dates selected. Only surveys that were conducted within this date range are included in the trip rate calculation.

Selected survey days:

Tuesday	2 days
Wednesday	2 days
Thursday	2 days
Friday	2 days

This data displays the number of selected surveys by day of the week.

Selected survey types:

Manual count	8 days
Directional ATC Count	0 days

This data displays the number of manual classified surveys and the number of unclassified ATC surveys, the total adding up to the overall number of surveys in the selected set. Manual surveys are undertaken using staff, whilst ATC surveys are undertaking using machines.

Selected Locations:

Edge of Town	8

This data displays the number of surveys per main location category within the selected set. The main location categories consist of Free Standing, Edge of Town, Suburban Area, Neighbourhood Centre, Edge of Town Centre, Town Centre and Not Known.

Selected Location Sub Categories:

Industrial Zone	4
Commercial Zone	1
Residential Zone	2
No Sub Category	1

APPENDIX 1.1

VEHICLE REPAIR GARAGE

This data displays the number of surveys per location sub-category within the selected set. The location sub-categories consist of Commercial Zone, Industrial Zone, Development Zone, Residential Zone, Retail Zone, Built-Up Zone, Village, Out of Town, High Street and No Sub Category.

Secondary Filtering selection:

Use Class:

Not Known	8 days

This data displays the number of surveys per Use Class classification within the selected set. The Use Classes Order 2005 has been used for this purpose, which can be found within the Library module of TRICS®.

Population within 500m Range:

All Surveys Included

Population within 1 mile:

1,001 to 5,000	1 days
5,001 to 10,000	3 days
10,001 to 15,000	2 days
15,001 to 20,000	2 days

This data displays the number of selected surveys within stated 1-mile radii of population.

Population within 5 miles:

25,001 to 50,000	1 days
50,001 to 75,000	1 days
100,001 to 125,000	1 days
125,001 to 250,000	2 days
250,001 to 500,000	3 days

This data displays the number of selected surveys within stated 5-mile radii of population.

Car ownership within 5 miles:

0.6 to 1.0	4 days
1.1 to 1.5	4 days

This data displays the number of selected surveys within stated ranges of average cars owned per residential dwelling, within a radius of 5-miles of selected survey sites.

Travel Plan:

Not Known	1 days
No	7 days

This data displays the number of surveys within the selected set that were undertaken at sites with Travel Plans in place, and the number of surveys that were undertaken at sites without Travel Plans.

PTAL Rating:

No PTAL Present	8 days

This data displays the number of selected surveys with PTAL Ratings.

20:00 - 21:00									
21:00 - 22:00									
22:00 - 23:00									
23:00 - 24:00									
Total Rates:			9.358			9.189			18.547

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

*To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.*

Parameter summary

Trip rate parameter range selected:	290 - 5100 (units: sqm)
Survey date date range:	01/01/00 - 28/06/19
Number of weekdays (Monday-Friday):	8
Number of Saturdays:	0
Number of Sundays:	0
Surveys automatically removed from selection:	0
Surveys manually removed from selection:	0

This section displays a quick summary of some of the data filtering selections made by the TRICS® user. The trip rate calculation parameter range of all selected surveys is displayed first, followed by the range of minimum and maximum survey dates selected by the user. Then, the total number of selected weekdays and weekend days in the selected set of surveys are show. Finally, the number of survey days that have been manually removed from the selected set outside of the standard filtering procedure are displayed.

Primary Filtering selection:

This data displays the chosen trip rate parameter and its selected range. Only sites that fall within the parameter range are included in the trip rate calculation.

Parameter: Gross floor area
Actual Range: 190 to 37530 (units: sqm)
Range Selected by User: 190 to 80066 (units: sqm)

Parking Spaces Range: All Surveys Included

Public Transport Provision:
Selection by: Include all surveys

Date Range: 01/01/13 to 25/11/20

This data displays the range of survey dates selected. Only surveys that were conducted within this date range are included in the trip rate calculation.

Selected survey days:

Monday	2 days
Wednesday	1 days
Thursday	2 days
Friday	5 days

This data displays the number of selected surveys by day of the week.

Selected survey types:

Manual count	10 days
Directional ATC Count	0 days

This data displays the number of manual classified surveys and the number of unclassified ATC surveys, the total adding up to the overall number of surveys in the selected set. Manual surveys are undertaken using staff, whilst ATC surveys are undertaking using machines.

Selected Locations:

Edge of Town	10

This data displays the number of surveys per main location category within the selected set. The main location categories consist of Free Standing, Edge of Town, Suburban Area, Neighbourhood Centre, Edge of Town Centre, Town Centre and Not Known.

APPENDIX 1.2

COMMERCIAL WAREHOUSING

Selected Location Sub Categories:

Industrial Zone	9
Commercial Zone	1

This data displays the number of surveys per location sub-category within the selected set. The location sub-categories consist of Commercial Zone, Industrial Zone, Development Zone, Residential Zone, Retail Zone, Built-Up Zone, Village,

Secondary Filtering selection:

Use Class:

n/a	2 days
B8	8 days

This data displays the number of surveys per Use Class classification within the selected set. The Use Classes Order 2005 has been used for this purpose, which can be found within the Library module of TRICS®.

Filter by Site Operations Breakdown:
All Surveys Included

Population within 500m Range:
All Surveys Included

Population within 1 mile:

1,000 or Less	1 days
1,001 to 5,000	1 days
5,001 to 10,000	3 days
10,001 to 15,000	1 days
15,001 to 20,000	2 days
20,001 to 25,000	1 days
25,001 to 50,000	1 days

This data displays the number of selected surveys within stated 1-mile radii of population.

Population within 5 miles:

5,001 to 25,000	1 days
75,001 to 100,000	1 days
100,001 to 125,000	1 days
125,001 to 250,000	4 days
250,001 to 500,000	2 days
500,001 or More	1 days

This data displays the number of selected surveys within stated 5-mile radii of population.

Car ownership within 5 miles:

0.6 to 1.0	4 days
1.1 to 1.5	6 days

This data displays the number of selected surveys within stated ranges of average cars owned per residential dwelling, within a radius of 5-miles of selected survey sites.

Travel Plan:

No	10 days

This data displays the number of surveys within the selected set that were undertaken at sites with Travel Plans in place, and the number of surveys that were undertaken at sites without Travel Plans.

PTAL Rating:

No PTAL Present	10 days

This data displays the number of selected surveys with PTAL Ratings.

Covid-19 Restrictions	Yes	At least one survey within the selected data set was undertaken at a time of Covid-19 restrictions

22:00 - 23:00									
23:00 - 24:00									
Total Rates:			2.101			2.053			4.154

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

*To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.*

Parameter summary

Trip rate parameter range selected:	190 - 37530 (units: sqm)
Survey date date range:	01/01/13 - 25/11/20
Number of weekdays (Monday-Friday):	10
Number of Saturdays:	0
Number of Sundays:	0
Surveys automatically removed from selection:	0
Surveys manually removed from selection:	0

This section displays a quick summary of some of the data filtering selections made by the TRICS® user. The trip rate calculation parameter range of all selected surveys is displayed first, followed by the range of minimum and maximum survey dates selected by the user. Then, the total number of selected weekdays and weekend days in the selected set of surveys are show. Finally, the number of survey days that have been manually removed from the selected set outside of the standard filtering procedure are displayed.

TRIP RATE CALCULATION SELECTION PARAMETERS:

Land Use : 02 - EMPLOYMENT
Category : C - INDUSTRIAL UNIT
TOTAL VEHICLES

Selected regions and areas:

02	SOUTH EAST		
	HC	HAMPSHIRE	1 days
03	SOUTH WEST		
	BR	BRISTOL CITY	1 days
04	EAST ANGLIA		
	SF	SUFFOLK	1 days
06	WEST MIDLANDS		
	HE	HEREFORDSHIRE	1 days
08	NORTH WEST		
	LC	LANCASHIRE	1 days
09	NORTH		
	CB	CUMBRIA	1 days
11	SCOTLAND		
	SR	STIRLING	1 days

This section displays the number of survey days per TRICS® sub-region in the selected set

Primary Filtering selection:

This data displays the chosen trip rate parameter and its selected range. Only sites that fall within the parameter range are included in the trip rate calculation.

Parameter: Gross floor area
Actual Range: 1010 to 3000 (units: sqm)
Range Selected by User: 500 to 4000 (units: sqm)

Parking Spaces Range: All Surveys Included

Public Transport Provision:
Selection by: Include all surveys

Date Range: 01/01/13 to 22/10/20

This data displays the range of survey dates selected. Only surveys that were conducted within this date range are included in the trip rate calculation.

Selected survey days:

Monday	1 days
Tuesday	3 days
Thursday	2 days
Friday	1 days

This data displays the number of selected surveys by day of the week.

Selected survey types:

Manual count	7 days
Directional ATC Count	0 days

This data displays the number of manual classified surveys and the number of unclassified ATC surveys, the total adding up to the overall number of surveys in the selected set. Manual surveys are undertaken using staff, whilst ATC surveys are undertaking using machines.

Selected Locations:

Edge of Town	7

This data displays the number of surveys per main location category within the selected set. The main location categories consist of Free Standing, Edge of Town, Suburban Area, Neighbourhood Centre, Edge of Town Centre, Town Centre and Not Known.

Selected Location Sub Categories:

Industrial Zone	6
Commercial Zone	1

APPENDIX 1.3

INDUSTRIAL UNIT

This data displays the number of surveys per location sub-category within the selected set. The location sub-categories consist of Commercial Zone, Industrial Zone, Development Zone, Residential Zone, Retail Zone, Built-Up Zone, Village, Out of Town, High Street and No Sub Category.

Secondary Filtering selection:

Use Class:

Not Known	7 days

This data displays the number of surveys per Use Class classification within the selected set. The Use Classes Order 2005 has been used for this purpose, which can be found within the Library module of TRICS®.

Filter by Site Operations Breakdown:
All Surveys Included

Population within 500m Range:
All Surveys Included

Population within 1 mile:

1,001 to 5,000	1 days
5,001 to 10,000	2 days
10,001 to 15,000	2 days
20,001 to 25,000	1 days
25,001 to 50,000	1 days

This data displays the number of selected surveys within stated 1-mile radii of population.

Population within 5 miles:

5,001 to 25,000	1 days
50,001 to 75,000	1 days
75,001 to 100,000	2 days
100,001 to 125,000	1 days
125,001 to 250,000	1 days
250,001 to 500,000	1 days

This data displays the number of selected surveys within stated 5-mile radii of population.

Car ownership within 5 miles:

1.1 to 1.5	7 days

This data displays the number of selected surveys within stated ranges of average cars owned per residential dwelling, within a radius of 5-miles of selected survey sites.

Travel Plan:

No	7 days

This data displays the number of surveys within the selected set that were undertaken at sites with Travel Plans in place, and the number of surveys that were undertaken at sites without Travel Plans.

PTAL Rating:

No PTAL Present	7 days

This data displays the number of selected surveys with PTAL Ratings.

Total Rates:			3.219			2.986			6.205

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

*To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.*

Parameter summary

Trip rate parameter range selected:	1010 - 3000 (units: sqm)
Survey date date range:	01/01/13 - 22/10/20
Number of weekdays (Monday-Friday):	7
Number of Saturdays:	0
Number of Sundays:	0
Surveys automatically removed from selection:	0
Surveys manually removed from selection:	1

This section displays a quick summary of some of the data filtering selections made by the TRICS® user. The trip rate calculation parameter range of all selected surveys is displayed first, followed by the range of minimum and maximum survey dates selected by the user. Then, the total number of selected weekdays and weekend days in the selected set of surveys are show. Finally, the number of survey days that have been manually removed from the selected set outside of the standard filtering procedure are displayed.

Total Rates:			0.316			0.539			0.855

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

*To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.*

APPENDIX 2.0

TRICS: PROPOSED

2.1	House (Privately Owned)
2.2	Primary School
2.3	Convenience Store
2.4	Industrial Estate
2.5	Hotels

Calculation Reference: AUDIT-733701-210724-0705

TRIP RATE CALCULATION SELECTION PARAMETERS:

Land Use : 03 - RESIDENTIAL
Category : A - HOUSES PRIVATELY OWNED
MULTI-MODAL TOTAL VEHICLES

Selected regions and areas:

02	SOUTH EAST		
	ES	EAST SUSSEX	3 days
	KC	KENT	2 days
	SC	SURREY	1 days
05	EAST MIDLANDS		
	DS	DERBYSHIRE	1 days
06	WEST MIDLANDS		
	SH	SHROPSHIRE	1 days
	ST	STAFFORDSHIRE	1 days
07	YORKSHIRE & NORTH LINCOLNSHIRE		
	NE	NORTH EAST LINCOLNSHIRE	1 days
	NY	NORTH YORKSHIRE	1 days
09	NORTH		
	DH	DURHAM	1 days

This section displays the number of survey days per TRICS® sub-region in the selected set

Primary Filtering selection:

This data displays the chosen trip rate parameter and its selected range. Only sites that fall within the parameter range are included in the trip rate calculation.

Parameter: No of Dwellings
Actual Range: 54 to 432 (units:)
Range Selected by User: 50 to 600 (units:)

Parking Spaces Range: All Surveys Included

Parking Spaces per Dwelling Range: All Surveys Included

Bedrooms per Dwelling Range: All Surveys Included

Percentage of dwellings privately owned: All Surveys Included

Public Transport Provision:
Selection by: Include all surveys

Date Range: 01/01/13 to 08/10/20

This data displays the range of survey dates selected. Only surveys that were conducted within this date range are included in the trip rate calculation.

Selected survey days:

Monday	2 days
Tuesday	2 days
Wednesday	3 days
Thursday	2 days
Friday	3 days

This data displays the number of selected surveys by day of the week.

Selected survey types:

Manual count	12 days
Directional ATC Count	0 days

This data displays the number of manual classified surveys and the number of unclassified ATC surveys, the total adding up to the overall number of surveys in the selected set. Manual surveys are undertaken using staff, whilst ATC surveys are undertaking using machines.

APPENDIX 2.1

HOUSE (PRIVATELY OWNED)

Selected Locations:

Edge of Town	12

This data displays the number of surveys per main location category within the selected set. The main location categories consist of Free Standing, Edge of Town, Suburban Area, Neighbourhood Centre, Edge of Town Centre, Town Centre and Not Known.

Selected Location Sub Categories:

Residential Zone	10

This data displays the number of surveys per location sub-category within the selected set. The location sub-categories consist of Commercial Zone, Industrial Zone, Development Zone, Residential Zone, Retail Zone, Built-Up Zone, Village, Out of Town, High Street and No Sub Category.

Secondary Filtering selection:

Use Class:

C3	12 days

This data displays the number of surveys per Use Class classification within the selected set. The Use Classes Order 2005 has been used for this purpose, which can be found within the Library module of TRICS®.

Population within 500m Range:

All Surveys Included

Population within 1 mile:

1,000 or Less	1 days
5,001 to 10,000	3 days
10,001 to 15,000	6 days
15,001 to 20,000	2 days

This data displays the number of selected surveys within stated 1-mile radii of population.

Population within 5 miles:

5,001 to 25,000	1 days
25,001 to 50,000	1 days
50,001 to 75,000	2 days
75,001 to 100,000	2 days
100,001 to 125,000	1 days
125,001 to 250,000	5 days

This data displays the number of selected surveys within stated 5-mile radii of population.

Car ownership within 5 miles:

0.6 to 1.0	3 days
1.1 to 1.5	9 days

This data displays the number of selected surveys within stated ranges of average cars owned per residential dwelling, within a radius of 5-miles of selected survey sites.

Travel Plan:

No	12 days

This data displays the number of surveys within the selected set that were undertaken at sites with Travel Plans in place, and the number of surveys that were undertaken at sites without Travel Plans.

PTAL Rating:

No PTAL Present	12 days

This data displays the number of selected surveys with PTAL Ratings.

21:00 - 22:00									
22:00 - 23:00									
23:00 - 24:00									
Total Rates:			2.215			2.232			4.447

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

*To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.*

Parameter summary

Trip rate parameter range selected:	54 - 432 (units:)
Survey date date range:	01/01/13 - 08/10/20
Number of weekdays (Monday-Friday):	12
Number of Saturdays:	0
Number of Sundays:	0
Surveys automatically removed from selection:	0
Surveys manually removed from selection:	0

This section displays a quick summary of some of the data filtering selections made by the TRICS® user. The trip rate calculation parameter range of all selected surveys is displayed first, followed by the range of minimum and maximum survey dates selected by the user. Then, the total number of selected weekdays and weekend days in the selected set of surveys are show. Finally, the number of survey days that have been manually removed from the selected set outside of the standard filtering procedure are displayed.

22:00 - 23:00									
23:00 - 24:00									
Total Rates:			0.104			0.107			0.211

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

*To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.*

TRIP RATE CALCULATION SELECTION PARAMETERS:

Land Use : 04 - EDUCATION
Category : A - PRIMARY
MULTI-MODAL TOTAL VEHICLES

Selected regions and areas:

03	SOUTH WEST		
	DV	DEVON	1 days
06	WEST MIDLANDS		
	WO	WORCESTERSHIRE	1 days
08	NORTH WEST		
	MS	MERSEYSIDE	2 days
10	WALES		
	MT	MERTHYR TYDFIL	1 days

This section displays the number of survey days per TRICS® sub-region in the selected set

Primary Filtering selection:

This data displays the chosen trip rate parameter and its selected range. Only sites that fall within the parameter range are included in the trip rate calculation.

Parameter: Number of pupils
Actual Range: 184 to 447 (units:)
Range Selected by User: 92 to 472 (units:)

Parking Spaces Range: All Surveys Included

Public Transport Provision:
Selection by: Include all surveys

Date Range: 01/01/00 to 03/04/19

This data displays the range of survey dates selected. Only surveys that were conducted within this date range are included in the trip rate calculation.

Selected survey days:

Monday	1 days
Thursday	2 days
Friday	2 days

This data displays the number of selected surveys by day of the week.

Selected survey types:

Manual count	5 days
Directional ATC Count	0 days

This data displays the number of manual classified surveys and the number of unclassified ATC surveys, the total adding up to the overall number of surveys in the selected set. Manual surveys are undertaken using staff, whilst ATC surveys are undertaking using machines.

Selected Locations:

Suburban Area (PPS6 Out of Centre)	5

This data displays the number of surveys per main location category within the selected set. The main location categories consist of Free Standing, Edge of Town, Suburban Area, Neighbourhood Centre, Edge of Town Centre, Town Centre and Not Known.

Selected Location Sub Categories:

Residential Zone	5

This data displays the number of surveys per location sub-category within the selected set. The location sub-categories consist of Commercial Zone, Industrial Zone, Development Zone, Residential Zone, Retail Zone, Built-Up Zone, Village, Out of Town, High Street and No Sub Category.

APPENDIX 2.2

PRIMARY SCHOOL

Secondary Filtering selection:

Use Class:

F1(a)	5 days

This data displays the number of surveys per Use Class classification within the selected set. The Use Classes Order 2005 has been used for this purpose, which can be found within the Library module of TRICS®.

Population within 500m Range:

All Surveys Included

Population within 1 mile:

5,001 to 10,000	1 days
15,001 to 20,000	3 days
20,001 to 25,000	1 days

This data displays the number of selected surveys within stated 1-mile radii of population.

Population within 5 miles:

50,001 to 75,000	1 days
75,001 to 100,000	1 days
250,001 to 500,000	3 days

This data displays the number of selected surveys within stated 5-mile radii of population.

Car ownership within 5 miles:

0.6 to 1.0	3 days
1.1 to 1.5	2 days

This data displays the number of selected surveys within stated ranges of average cars owned per residential dwelling, within a radius of 5-miles of selected survey sites.

Travel Plan:

No	5 days

This data displays the number of surveys within the selected set that were undertaken at sites with Travel Plans in place, and the number of surveys that were undertaken at sites without Travel Plans.

PTAL Rating:

No PTAL Present	5 days

This data displays the number of selected surveys with PTAL Ratings.

Total Rates:			0.844			0.828			1.672

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

*To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.*

Parameter summary

Trip rate parameter range selected:	184 - 447 (units:)
Survey date date range:	01/01/00 - 03/04/19
Number of weekdays (Monday-Friday):	5
Number of Saturdays:	0
Number of Sundays:	0
Surveys automatically removed from selection:	0
Surveys manually removed from selection:	2

This section displays a quick summary of some of the data filtering selections made by the TRICS® user. The trip rate calculation parameter range of all selected surveys is displayed first, followed by the range of minimum and maximum survey dates selected by the user. Then, the total number of selected weekdays and weekend days in the selected set of surveys are show. Finally, the number of survey days that have been manually removed from the selected set outside of the standard filtering procedure are displayed.

22:00 - 23:00									
23:00 - 24:00									
Total Rates:			1.318			1.333			2.651

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

*To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.*

TRIP RATE CALCULATION SELECTION PARAMETERS:

Land Use : 01 - RETAIL
Category : O - CONVENIENCE STORE
MULTI-MODAL TOTAL VEHICLES

Selected regions and areas:

02	SOUTH EAST		
	ES	EAST SUSSEX	1 days
03	SOUTH WEST		
	BA	BATH & NORTH EAST SOMERSET	1 days
	DC	DORSET	1 days
	WL	WILTSHIRE	1 days
04	EAST ANGLIA		
	NF	NORFOLK	1 days
11	SCOTLAND		
	FA	FALKIRK	1 days

This section displays the number of survey days per TRICS® sub-region in the selected set

Primary Filtering selection:

This data displays the chosen trip rate parameter and its selected range. Only sites that fall within the parameter range are included in the trip rate calculation.

Parameter: Gross floor area
Actual Range: 165 to 300 (units: sqm)
Range Selected by User: 100 to 300 (units: sqm)

Parking Spaces Range: All Surveys Included

Public Transport Provision:
Selection by: Include all surveys

Date Range: 01/01/00 to 25/09/19

This data displays the range of survey dates selected. Only surveys that were conducted within this date range are included in the trip rate calculation.

Selected survey days:

Monday	1 days
Wednesday	1 days
Friday	4 days

This data displays the number of selected surveys by day of the week.

Selected survey types:

Manual count	6 days
Directional ATC Count	0 days

This data displays the number of manual classified surveys and the number of unclassified ATC surveys, the total adding up to the overall number of surveys in the selected set. Manual surveys are undertaken using staff, whilst ATC surveys are undertaking using machines.

Selected Locations:

Suburban Area (PPS6 Out of Centre)	6

This data displays the number of surveys per main location category within the selected set. The main location categories consist of Free Standing, Edge of Town, Suburban Area, Neighbourhood Centre, Edge of Town Centre, Town Centre and Not Known.

Selected Location Sub Categories:

Residential Zone	6

This data displays the number of surveys per location sub-category within the selected set. The location sub-categories consist of Commercial Zone, Industrial Zone, Development Zone, Residential Zone, Retail Zone, Built-Up Zone, Village, Out of Town, High Street and No Sub Category.

APPENDIX 2.3

CONVENIENCE STORE

Secondary Filtering selection:

Use Class:

Not Known	3 days
E(a)	3 days

This data displays the number of surveys per Use Class classification within the selected set. The Use Classes Order 2005 has been used for this purpose, which can be found within the Library module of TRICS®.

Population within 500m Range:

All Surveys Included

Population within 1 mile:

15,001 to 20,000	3 days
20,001 to 25,000	1 days
25,001 to 50,000	2 days

This data displays the number of selected surveys within stated 1-mile radii of population.

Population within 5 miles:

25,001 to 50,000	1 days
75,001 to 100,000	1 days
100,001 to 125,000	2 days
125,001 to 250,000	2 days

This data displays the number of selected surveys within stated 5-mile radii of population.

Car ownership within 5 miles:

0.6 to 1.0	3 days
1.1 to 1.5	3 days

This data displays the number of selected surveys within stated ranges of average cars owned per residential dwelling, within a radius of 5-miles of selected survey sites.

Petrol filling station:

Included in the survey count	0 days
Excluded from count or no filling station	6 days

This data displays the number of surveys within the selected set that include petrol filling station activity, and the number of surveys that do not.

Travel Plan:

No	6 days

This data displays the number of surveys within the selected set that were undertaken at sites with Travel Plans in place, and the number of surveys that were undertaken at sites without Travel Plans.

PTAL Rating:

No PTAL Present	6 days

This data displays the number of selected surveys with PTAL Ratings.

4 FA-01-O-01 SPAR FALKIRK
THORNHILL ROAD
FALKIRK

Suburban Area (PPS6 Out of Centre)
Residential Zone
Total Gross floor area: 300 sqm
Survey date: MONDAY *09/04/07* *Survey Type: MANUAL*

5 NF-01-O-01 TESCO EXPRESS NORFOLK
DEREHAM ROAD
NORWICH

Suburban Area (PPS6 Out of Centre)
Residential Zone
Total Gross floor area: 298 sqm
Survey date: FRIDAY *26/10/12* *Survey Type: MANUAL*

6 WL-01-O-01 ONE STOP WILTSHIRE
THE CIRCLE
SWINDON

Suburban Area (PPS6 Out of Centre)
Residential Zone
Total Gross floor area: 292 sqm
Survey date: FRIDAY *23/09/16* *Survey Type: MANUAL*

This section provides a list of all survey sites and days in the selected set. For each individual survey site, it displays a unique site reference code and site address, the selected trip rate calculation parameter and its value, the day of the week and date of each survey, and whether the survey was a manual classified count or an ATC count.

23:00 - 24:00									
Total Rates:			133.164			132.027			265.191

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

*To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.*

Parameter summary

Trip rate parameter range selected:	165 - 300 (units: sqm)
Survey date date range:	01/01/00 - 25/09/19
Number of weekdays (Monday-Friday):	6
Number of Saturdays:	0
Number of Sundays:	0
Surveys automatically removed from selection:	0
Surveys manually removed from selection:	0

This section displays a quick summary of some of the data filtering selections made by the TRICS® user. The trip rate calculation parameter range of all selected surveys is displayed first, followed by the range of minimum and maximum survey dates selected by the user. Then, the total number of selected weekdays and weekend days in the selected set of surveys are show. Finally, the number of survey days that have been manually removed from the selected set outside of the standard filtering procedure are displayed.

Total Rates:			10.416			10.110			20.526

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

*To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.*

Calculation Reference: AUDIT-733701-210724-0741

TRIP RATE CALCULATION SELECTION PARAMETERS:

Land Use : 02 - EMPLOYMENT
Category : D - INDUSTRIAL ESTATE
MULTI-MODAL TOTAL VEHICLES

Selected regions and areas:

06	WEST MIDLANDS		
	WK	WARWICKSHIRE	2 days
	WO	WORCESTERSHIRE	1 days
07	YORKSHIRE & NORTH LINCOLNSHIRE		
	NY	NORTH YORKSHIRE	1 days
11	SCOTLAND		
	AG	ANGUS	1 days

This section displays the number of survey days per TRICS® sub-region in the selected set

Primary Filtering selection:

This data displays the chosen trip rate parameter and its selected range. Only sites that fall within the parameter range are included in the trip rate calculation.

Parameter: Gross floor area
Actual Range: 20860 to 150564 (units: sqm)
Range Selected by User: 20000 to 974258 (units: sqm)

Parking Spaces Range: All Surveys Included

Public Transport Provision:
Selection by: Include all surveys

Date Range: 01/01/13 to 26/09/19

This data displays the range of survey dates selected. Only surveys that were conducted within this date range are included in the trip rate calculation.

Selected survey days:

Tuesday	3 days
Wednesday	1 days
Thursday	1 days

This data displays the number of selected surveys by day of the week.

Selected survey types:

Manual count	5 days
Directional ATC Count	0 days

This data displays the number of manual classified surveys and the number of unclassified ATC surveys, the total adding up to the overall number of surveys in the selected set. Manual surveys are undertaken using staff, whilst ATC surveys are undertaking using machines.

Selected Locations:

Edge of Town	5

This data displays the number of surveys per main location category within the selected set. The main location categories consist of Free Standing, Edge of Town, Suburban Area, Neighbourhood Centre, Edge of Town Centre, Town Centre and Not Known.

Selected Location Sub Categories:

Industrial Zone	2
Out of Town	2
No Sub Category	1

This data displays the number of surveys per location sub-category within the selected set. The location sub-categories consist of Commercial Zone, Industrial Zone, Development Zone, Residential Zone, Retail Zone, Built-Up Zone, Village, Out of Town, High Street and No Sub Category.

APPENDIX 2.4
INDUSTRIAL ESTATE

Secondary Filtering selection:

Use Class:

Not Known	5 days

This data displays the number of surveys per Use Class classification within the selected set. The Use Classes Order 2005 has been used for this purpose, which can be found within the Library module of TRICS®.

Filter by Site Operations Breakdown:
All Surveys Included

Population within 500m Range:
All Surveys Included

Population within 1 mile:

5,001 to 10,000	3 days
10,001 to 15,000	1 days
20,001 to 25,000	1 days

This data displays the number of selected surveys within stated 1-mile radii of population.

Population within 5 miles:

25,001 to 50,000	3 days
75,001 to 100,000	1 days
125,001 to 250,000	1 days

This data displays the number of selected surveys within stated 5-mile radii of population.

Car ownership within 5 miles:

1.1 to 1.5	5 days

This data displays the number of selected surveys within stated ranges of average cars owned per residential dwelling, within a radius of 5-miles of selected survey sites.

Travel Plan:

No	5 days

This data displays the number of surveys within the selected set that were undertaken at sites with Travel Plans in place, and the number of surveys that were undertaken at sites without Travel Plans.

PTAL Rating:

No PTAL Present	5 days

This data displays the number of selected surveys with PTAL Ratings.

Total Rates:			2.633			2.566			5.199

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

*To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.*

Parameter summary

Trip rate parameter range selected:	20860 - 150564 (units: sqm)
Survey date date range:	01/01/13 - 26/09/19
Number of weekdays (Monday-Friday):	5
Number of Saturdays:	0
Number of Sundays:	0
Surveys automatically removed from selection:	0
Surveys manually removed from selection:	2

This section displays a quick summary of some of the data filtering selections made by the TRICS® user. The trip rate calculation parameter range of all selected surveys is displayed first, followed by the range of minimum and maximum survey dates selected by the user. Then, the total number of selected weekdays and weekend days in the selected set of surveys are show. Finally, the number of survey days that have been manually removed from the selected set outside of the standard filtering procedure are displayed.

22:00 - 23:00									
23:00 - 24:00									
Total Rates:			0.221			0.212			0.433

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

*To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.*

Calculation Reference: AUDIT-733701-210811-0817

TRIP RATE CALCULATION SELECTION PARAMETERS:

Land Use : 06 - HOTEL, FOOD & DRINK
Category : A - HOTELS
MULTI-MODAL TOTAL VEHICLES

Selected regions and areas:

02	SOUTH EAST		
	BU	BUCKINGHAMSHIRE	1 days
03	SOUTH WEST		
	DV	DEVON	1 days
04	EAST ANGLIA		
	NF	NORFOLK	1 days
05	EAST MIDLANDS		
	LE	LEICESTERSHIRE	1 days
10	WALES		
	SW	SWANSEA	1 days
11	SCOTLAND		
	AG	ANGUS	1 days

This section displays the number of survey days per TRICS® sub-region in the selected set

Primary Filtering selection:

This data displays the chosen trip rate parameter and its selected range. Only sites that fall within the parameter range are included in the trip rate calculation.

Parameter: Gross floor area
Actual Range: 720 to 17624 (units: sqm)
Range Selected by User: 720 to 17624 (units: sqm)

Parking Spaces Range: All Surveys Included

Public Transport Provision:
Selection by: Include all surveys

Date Range: 01/01/10 to 25/11/19

This data displays the range of survey dates selected. Only surveys that were conducted within this date range are included in the trip rate calculation.

Selected survey days:

Monday	1 days
Tuesday	1 days
Wednesday	2 days
Thursday	2 days

This data displays the number of selected surveys by day of the week.

Selected survey types:

Manual count	6 days
Directional ATC Count	0 days

This data displays the number of manual classified surveys and the number of unclassified ATC surveys, the total adding up to the overall number of surveys in the selected set. Manual surveys are undertaken using staff, whilst ATC surveys are undertaking using machines.

Selected Locations:

Edge of Town	6

This data displays the number of surveys per main location category within the selected set. The main location categories consist of Free Standing, Edge of Town, Suburban Area, Neighbourhood Centre, Edge of Town Centre, Town Centre and Not Known.

Selected Location Sub Categories:

Industrial Zone	1
Commercial Zone	1
Development Zone	1
Residential Zone	1
Out of Town	1
No Sub Category	1

APPENDIX 2.5
HOTELS

This data displays the number of surveys per location sub-category within the selected set. The location sub-categories consist of Commercial Zone, Industrial Zone, Development Zone, Residential Zone, Retail Zone, Built-Up Zone, Village, Out of Town, High Street and No Sub Category.

Secondary Filtering selection:

Use Class:

C1	6 days

This data displays the number of surveys per Use Class classification within the selected set. The Use Classes Order 2005 has been used for this purpose, which can be found within the Library module of TRICS®.

Population within 500m Range:

All Surveys Included

Population within 1 mile:

5,001 to 10,000	4 days
10,001 to 15,000	1 days
100,001 or More	1 days

This data displays the number of selected surveys within stated 1-mile radii of population.

Population within 5 miles:

25,001 to 50,000	1 days
100,001 to 125,000	1 days
125,001 to 250,000	2 days
250,001 to 500,000	2 days

This data displays the number of selected surveys within stated 5-mile radii of population.

Car ownership within 5 miles:

0.6 to 1.0	2 days
1.1 to 1.5	4 days

This data displays the number of selected surveys within stated ranges of average cars owned per residential dwelling, within a radius of 5-miles of selected survey sites.

Travel Plan:

No	6 days

This data displays the number of surveys within the selected set that were undertaken at sites with Travel Plans in place, and the number of surveys that were undertaken at sites without Travel Plans.

PTAL Rating:

No PTAL Present	6 days

This data displays the number of selected surveys with PTAL Ratings.

	Survey date: MONDAY		*07/10/19*	*Survey Type: MANUAL*

This section provides a list of all survey sites and days in the selected set. For each individual survey site, it displays a unique site reference code and site address, the selected trip rate calculation parameter and its value, the day of the week and date of each survey, and whether the survey was a manual classified count or an ATC count.

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

*To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.*

Parameter summary

Trip rate parameter range selected:	720 - 17624 (units: sqm)
Survey date date range:	01/01/10 - 25/11/19
Number of weekdays (Monday-Friday):	6
Number of Saturdays:	0
Number of Sundays:	0
Surveys automatically removed from selection:	0
Surveys manually removed from selection:	0

This section displays a quick summary of some of the data filtering selections made by the TRICS® user. The trip rate calculation parameter range of all selected surveys is displayed first, followed by the range of minimum and maximum survey dates selected by the user. Then, the total number of selected weekdays and weekend days in the selected set of surveys are show. Finally, the number of survey days that have been manually removed from the selected set outside of the standard filtering procedure are displayed.

21:00 - 22:00	6	6911	0.198	6	6911	0.203	6	6911	0.401
22:00 - 23:00									
23:00 - 24:00									
Total Rates:			6.295			6.318			12.613

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

*To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.*

Subject: RE: mixed-use development at Shoreham Cement Works, Steyning Road, Upper Beeding, BN44 3TX

Good Morning David

Thank you for the comments.

I have summarised my response to your comments as follows:

1) Permitted trips will indeed be subtracted from the proposed use to obtain 'net' increase in trip generation. Within our final Transport Study Report, we will include this.
2) We are awaiting SDNPA response on what type of leisure use that they envisage to be on site. Once we have a knowledge of this, we will include it in our trip generation assessment. We are also seeking clarification from SDNPA regarding the area proposed for hotel use.
3) Total trip generation (taking into account school internalised trips) will be considered within our Transport Study Report.
4) With regard to internalised employment trips, we have already provided our evidence in the form of Census data within TN1. We do not consider any further evidence is necessary.
5) Table 5A and 5B provides percentage split of trips that will either be distributed based on Census HBW or MND HBO (residential) and Census HBW and MND NHB (employment). Full trip distribution will be included within the Transport Study Report.
6) A CMP would be prepared as part of any future planning application subject to the decision made by the LPA.

Thank you.

Kind regards

Subject: mixed-use development at Shoreham Cement Works, Steyning Road, Upper Beeding, BN44 3TX

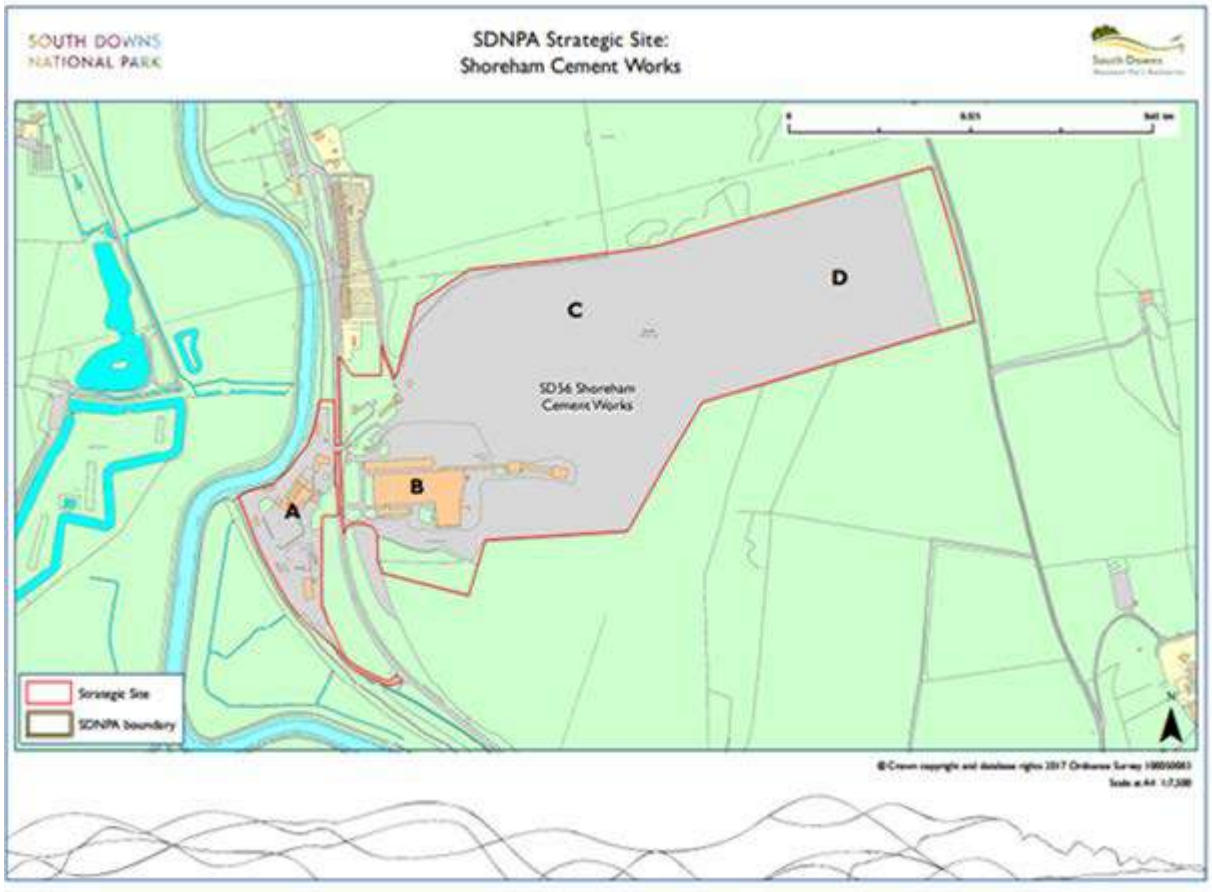
APPENDIX 1.4
NATIONAL HIGHWAYS COMMENTS ON TECHNICAL NOTE 1

Dear Amol,

Further to our meeting on Wednesday 14th July 2021, the following review relates to the Technical Note (ADL Ref: 5201 – August 2021) supplied to us on Thursday 19th August 2021 for a mixed-use development at Shoreham Cement Works, Steyning Road, Upper Beeding, BN44 3TX.

Please see below for our comments which includes advice on certain aspects such as the trip generation, distribution, and assignment which we would expect to see contained within the resulting Transport Assessment (TA). The technical note looks at three development scenarios for sites located east and west of the A283 as shown in the table and figure below:

Land Use	Scenario A	Scenario B	Scenario C
Dwellings	400 250 homes to the west of the A283, 150 homes to the east	240 150 homes to the west of the A283, 90 homes to the east	110 100 homes to the west of the A283, 10 homes to the east
A1 sqm	200	200	200
D1 sqm	2,000	2,000	0
B1 (b/c) sqm	32,000	32,000	0
B2 sqm	16,200	16,200	0
D2 sqm	0	0	18,500
C1 sqm	7,500	7,500	37,000
B8 sqm	20,000	20,000	0



Technical Note - TN5201 – prepared by ADL dated August 2021

Site Location

We note that the site is located approximately 2.2 kilometres north of the Shoreham Bypass along the A27 and therefore does not abut the SRN. Highways England will be concerned with any proposals which have the potential to impact on the safe and efficient operation of the SRN, in this case, particularly within vicinity of the A27.

Development Proposals

The proposed mixed-use development is split between two parcels of land which has proposals for the following land-uses:

- C3 - Dwellings;
- E(a) - shops (formerly A1);
- F1 - Non-residential institutions (formerly D1);
- E(d) - Leisure (formerly D2);
- B1(b/c) - Business;
- B2 - General Industrial;
- B8 - Storage and Distribution; and
- C1 - Hotels

The development to the east and west of the A283 constitutes the following land-use and is split across the three scenarios as shown in Table 3A/B below:

Table 3A Development Scenarios – East of A283

	Scenario A	Scenario B	Scenario C
Dwellings	150	90	10
A1 (sqm)	200	200	200
D1 (sqm)	2,000	2,000	0
B1 (b/c) (sqm)	32,000	32,000	0
B2 (sqm)	16,200	16,200	0
D2 (sqm)	0	0	18,500
C1 (sqm)	7,500	7,500	37,000
B8 (sqm)	20,000	20,000	0

Table 3B Development Scenario – West of A283

	Scenario A	Scenario B	Scenario C
Dwelling	250	150	100

All further comments are based on the above development quantum.

Development Trip rates and Trip Generation

Extant Use

For the past five years the main cement works site has a site area of 6.23 hectares and generates a maximum of 100 HGV two-way movements on a typical weekday, the peak hours would equate to 10% of the daily trips resulting in 10 two-way HGV movements during 08:00 – 09:00 and 17:00 – 18:00.

The land located to the west of the A283 has a site area of 3.45 hectares and currently has planning permission granted for the site to be used for B1, B2 and B8 uses (business, industry and storage) until January 2025 with 30 businesses based at this site at present.

In terms of trip generation, the site is estimated to see a total of **92 two-way** trips in the AM peak and **74 two-way** trips in the PM peak as shown in Table 2C below:

Table 2C Total Permitted Vehicular Trip Generation

		In	Out
Cement Works Site	08:00-09:00	5	5
	17:00-18:00	5	5
West of A283	08:00-09:00	60	22
	17:00-18:00	17	47

It is unclear whether the trips have been netted off from the extant use or whether they have been incorporated into the proposed use. This will need clarification as to avoid double-counting into calculations.

ACTION: Applicant to provide further clarification whether permitted trips from the extant use of the development has been subtracted from the proposed use to provide a net trip generation to account for the current level of trip generation at the site. The approach taken to consider trips associated with the existing site use must be clearly documented within the overall trip generation calculations. The approach taken must be clearly justified.

Proposed Use

The proposed trip rates and trip generation for the weekday peak periods (08:00 – 09:00 and 17:00 – 18:00) have been determined utilising multi-modal surveys across the UK excluding, London, Wales and Scotland for sites specific to edge of town and suburban where edge of town sites were not available. This is considered to be an acceptable method for obtaining trip rates.

Based on our calculations using the applicants proposed vehicle trip rates, for both parcels of land as a whole, the predicted traffic generation is as follows (note no trip internalisation has been factored in the below calculations):

- Scenario A is predicted to generate a total of **500 two-way** vehicular trips in the morning peak hour and **448 two-way** vehicular trips in the evening peak hour.
- Scenario B is predicted to generate a total of **469 two-way** vehicular trips in the morning peak hour and **420 two-way** vehicular trips in the evening peak hour.
- Scenario C is predicted to generate a total of **379 two-way** vehicular trips in the morning peak hour and **290 two-way** vehicular trips in the evening peak hour.

To confirm the acceptability of this data, an independent assessment within TRICS was also undertaken and we note that Scenario C shows 18,500sqm of E(d) – Leisure has not been incorporated within the TRICS trip rates. This will be required for inclusion as this is likely to impact trip generation. The trip rates for all other land uses are accepted.

ACTION: Applicant should provide the necessary TRICS data for E(d) – Leisure use and incorporate it within an updated Technical Note for Highways England to review.

Internalised Trips – Primary School

TRICS has been used in combination with 2011 Census data to formulate a calculation to understand the proportion of internalised trips based on the number of dwellings throughout scenario A, B and C.

Scenario A presents 400 homes with an occupancy of a total of 934 people living within the development and 157 primary school children. This calculation is based on Census data proportioning by comparing the total population of West Sussex with the number of primary school aged children within this region and then applying this ratio to the development scenarios, which is an accepted method. TRICS shows a ratio of 1 pupil to every 6sqm of school area. For a proposed area of 2,000sqm this shows capacity for the school to accommodate 333 pupils. Of the total capacity for 333, 157 pupils are to originate from within the development, leaving 176 pupils travelling from nearby areas such as Upper Beeding and Steyning. This equates to **47.1% internalised trips** and **52.9% external trips** from surrounding areas.

Scenario B presents 240 homes with an occupancy of a total of 560 people living within the development and 94 primary school children, based on Census data and the method described above. TRICS shows a ratio of 1 pupil to every 6sqm of school area. For a proposed area of 2,000sqm this shows capacity for the school to accommodate 333 pupils. Of the total capacity for 333, 94 pupils are to originate from within the development, leaving 239 pupils travelling from nearby areas such as Upper Beeding and Steyning. This equates to **28.2% internalised trips** and **71.8% external trips** from surrounding areas of the development.

Scenario C presents 110 homes but has no proposals for a school development.

In summary, the internalised trips from a residential point of view is accepted as sensible however, these calculations will need to be factored into the trip generation to reflect the degree of trip internalisation.

ACTION: Applicant to provide calculations for generating total trip generation, with a clear method showing the number of discounted internal education trips for each of the three proposed development scenarios.

Internalised Trips – Employment Uses

In terms of employment uses, paragraph 4.2.1 states that 2011 Census data reveals that out of 899 people that travelled to this SOA to work, 170 live in this SOA which equates to 19%. Whilst this may be the case, evidence is required to show that the selected parameters are representative of the characteristics of the proposed development, given the mixed-use nature of the proposal.

Convenience Store Trips

Paragraph 4.3.1 states that the proposed convenience store would be a local facility predominantly used by its residents and staff living and working within the development. It is accepted that this type of facility would be unlikely to attract external trips.

Distribution and Assignment of Proposed Development Traffic

As was agreed by South Downs National Park Authority (SDNPA) and WSCC, for residential purposes, a split between Census journey to work data and Mobile Network Data for home-based trips is to be utilised. For all other purposes, it was agreed that Mobile Network Data was appropriate. Whilst the approach of using a combination of Mobile Network Data and Census journey to work data is agreeable, it is not clearly presented within the below tables. Clarification is required so it is clearly identifiable what each of the percentage splits refer to.

Table 5A Residential Trip Distribution Split

	In		O
	Census HBW	MND HBO	Census HBW
AM Peak Hours	4%	96%	58%
PM Peak Hours	52%	48%	0%

Table 5B Employment Trip Distribution Split

	In		O
	Census	MND	Census

Additionally, the previous TN (dated July 2021) had shown the distribution and assignment in Appendices 3.1 and 3.2 which has since been removed. This should be updated to reflect the changes to the distribution methodology.

A further review will be required in autumn to determine if/whether there are any subsequent changes in traffic due to the COVID-19 restrictions.

ACTION: Applicant to provide clarification on Tables 5A and 5B. Additionally, distribution and assignment as per the previous Appendices 3.1 and 3.2 will need to be provided reflecting the changes to the methodology.

Traffic Flows

Observed traffic flows with corresponding queue length data will be required for review to understand how trips produced from the proposed development impacts the nearest SRN junction, namely the A27 Shoreham Bypass. The applicant should be aware that the current guidance from Highways England states that traffic data collection may be appropriate from September 2021, subject to no further changes in government's pandemic-related policies. However, caveats and sensitivity testing are likely to be required, whilst ongoing data collection (possibly post-submission) may also be needed.

Additional Comments

A Construction Management Plan will be required to minimise the impact on the SRN and to ensure that the A27 continues to be an effective part of the national system of routes for through traffic in accordance with Section 10 of the Highways Act 1980 and to satisfy the reasonable requirements of road safety.

ACTION: A construction management plan will be required.

Conclusion

As detailed above, a number of issues have been identified which will require further consideration and additional information to be submitted for review, as set out in the required actions.

We look forward to continuous engagement with the project and being consulted as the proposals develop.

Thank you again for consulting at the pre-application stage with Highways England. If you have any queries, please do not hesitate to contact us at planningse@highwaysengland.co.uk.

TECHNICAL NOTE 2
SHOREHAM CEMENT WORKS
COMMITTED DEVELOPMENT ASSESSMENT
(ADL REF: 5201, 8TH SEPTEMBER 2021)

1.0 INTRODUCTION

1.1 ADL Traffic & Highways Engineering Ltd have been commissioned by South Downs National Park Authority (SDNPA) to undertake a transport study of the development scenarios at Shoreham Cement Works.

1.2 Discussions took place between SDNPA, WSCC and ADL on the matter of committed developments in August and September 2021.

1.3 This Technical Note 2 (TN2) summarises this discussion and provides the approach that has been agreed with SDNPA and WSCC.

2.0 COMMITTED DEVELOPMENT IN ADUR & WORTHING COUNCILS

2.1 Planning Policy Manager Mr T Moody of Adur & Worthing Councils provided a list of committed developments from 2018. In addition to these committed developments, Mr Moody also provided a list of allocated developments within emerging Worthing Local Plan.

2.2 Following Local Plan Allocation sites within Adur Local Plans were also noted:

- 1,100 dwellings allocated at Shoreham Harbour Regeneration Area: 1100 (minus the Free Wharf and Kingston Wharf consents);
- Land at West Sompting;
- New Monks Farm – as IKEA has announced that this store will not be delivered, the Council are seeking employment floorspace on the former IKEA land (Consistent with the Adur Local Plan 2017 Policy 5);
- AWDM/2139/20 Pilot Pub – Consent granted on 6th April 2021 for 34 dwellings.

2.3 A list of all committed developments and Local Plan Allocations is provided in Appendix 1.0.

ADL House, Oaklands Business Park, Armstrong Way, Yate, Bristol BS37 5NA | Tel: 01454 332 100 | Email: info@adltraffic.co.uk | Web: www.adltraffic.co.uk
Company No. 3121125 | VAT Registration No. 674 4017 36

2.4 The proposed methodology that has been accepted by WSCC is to represent committed developments and Local Plan allocations within overall growth for small to medium sites and to those that lie outside the immediate study area (i.e., beyond the area where the junction impacts are considered).

2.5 Therefore, except for New Monks Farm development and Shoreham Airport development, other sites will be represented within overall growth. New Monks Farm and Shoreham Airport development flows will be added manually and hence these developments are not listed in Appendix 1.0.

2.6 The number of dwellings and jobs (based on Employment Densities 3rd Edition) that would be generated as a result of the committed developments and Local Plan allocations (bar New Monks Farm and Shoreham Airport developments) is also provided in Appendix 1.0.

2.7 Based on this, there will be a total of 1,753 homes and 592 jobs created within Adur and 2,330 homes and 3,174 jobs created within Worthing as a result of all the committed developments and Local Plan allocations (bar New Monks Farm and Shoreham Airport development).

2.8 Adding the aforementioned homes and jobs to the 2018 baseline number of homes and jobs in TEMPRO would provide 2033 baseline number of homes and jobs (bar New Monks Farm and Shoreham Airport developments). [Note: The year 2018 has been used because the developments considered have been granted planning permissions since 2018].

2.9 The TEMPRO adjusted assumptions for the year 2033 based on the above methodology are provided in Table 2A.

Table 2A 2033 TEMPRO Adjusted Assumption

		2033
Adur DC	Homes	30,665
	Jobs	27,051
Worthing DC	Homes	52,179
	Jobs	62,432

2.10 These 2033 TEMPRO adjusted assumptions have been applied to obtain growth factors for:

- 2015-2033 (for surveys along the A27 which were undertaken in 2015)

- 2017-2033 (for surveys at A283/Upper Shoreham Road roundabout which were undertaken in 2017)

2.11 Based on the above, the TEMPRO growth factors that would be used are provided in Table 2B.

Table 2B TEMPRO Growth Factors

		Trunk Road	All roads
Adur DC (2015-2033)	AM	1.1600 (urban)	1.1534 (urban)
	PM	1.1574 (urban)	1.1508 (urban)
Adur DC (2017-2033)	AM	1.1352 (urban)	1.1294 (urban)
	PM	1.1315 (urban)	1.1257 (urban)
Worthing DC (2015-2033)	AM	1.1808 (urban)	1.1741 (urban)
	PM	1.1777 (urban)	1.1710 (urban)

2.12 With regard to Horsham DC, traffic surveys were carried out in 2019. The increase in the number of households from 2019 to 2033 equates to 10,789. The TEMPRO growth factors (2019 to 2033) for Horsham DC are obtained as 1.1620 (AM) and 1.1647 (PM). These TEMPRO growth factors are considered to be reasonably robust as they are likely to include all commitments within this district.

3.0 COMMITTED DEVELOPMENTS IN SOUTH DOWNS NATIONAL PARK AUTHORITY

3.1 A list of all committed developments were provided by SDNPA's Transport Officer Mr A Pringle. This is provided in Appendix 2.0.

3.2 Further discussions on this took place between SDNPA, WSCC and ADL and it was concluded that most developments did not require a Transport Assessment or Transport Statement and as such, these developments need not be included specifically within committed development assessment, as the TEMPRO growth factors would include these committed developments.

3.3 The permitted winery extensions development (SDNP/18/04995/FUL) however would be reviewed and its development flows will be added to the 2033 baseline scenario manually (similar to New Monks Farm and Shoreham Airport developments).

4.0 NEW MONKS FARM AND SHOREHAM AIRPORT DEVELOPMENTS

4.1 The Joint Transport submitted by Vectos in support of New Monks Farm and Shoreham Airport developments contains trip distribution associated with the permitted 600 dwellings (New Monks Farm site) and 25,000 sqm of employment space (Shoreham Airport site).

4.2 It is noted that IKEA which was part of the permitted development on New Monks Farm will no longer be delivered and that Adur and Worthing Council are seeking employment floorspace on the permitted IKEA land (consistent with the Adur Local Plan 2017).

4.3 ADL considers that using employment space as allocated land use would be more appropriate than using non-IKEA non-food retail floorspace. This is because the IKEA trip generation was based on IKEA specific trip rates and these trip rates are significantly less than other non-food retail floorspace.

4.4 The planning permission along with any associated highway improvements are therefore based on IKEA trip rates. Hence, ADL is of the view that for the purpose of trip generation associated with IKEA land, one should either use IKEA trip generation as it is truly permitted trip generation or use employment floorspace as it is still an allocated use for this parcel of land.

4.5 The trip generation for employment floorspace option would be based on the trip rates for Shoreham Airport development due to the identical nature of uses.

4.6 The trip rates are provided in Table 4A.

Table 4A IKEA and Employment Floorspace

		GFA = 32,900sqm		
		In	**Out**	**2-way**
IKEA	AM Peak Hour	23	5	28
	PM Peak Hour	171	180	351
Employment Floor Space	AM Peak Hour	165	30	195
	PM Peak Hour	13	128	141

4.7 As can be seen, employment uses generate more vehicular trips during AM peak hour whilst IKEA generate more vehicular trips during PM peak hour.

4.8 There are a number of conditions attached to this planning application (XXXX) restricting the type of usage of the site by opening hours and by type of goods and to a single unit and operation. These conditions are:

> ***"53. The non-food retail store hereby approved shall not be open to the public before 10:00 am Monday to Friday (excluding browsing time and use of the ancillary restaurant from 09:30 hours)."***
>
> ***"56. Notwithstanding the provisions of Class A1 of the Town and Country Planning Act 1990, Use Classes (amendment) Order 2005, the use of the non-food retail store shall be limited to the sale of bulky goods, DIY products, furniture and homewares and those goods and departments referred to in the Retail Statement prepared by DWD and for any ancillary uses which are offered in support of the main retail function."***
>
> ***"57. The non-food retail store hereby approved shall not be divided into more than one unit and shall be used for the purposes of a single retail operator unless otherwise agreed, in writing, with the local planning authority."***

4.9 This does result in a significant restriction to which types of non-food retailers would be eligible to occupy under the existing planning permission and also to the morning activities and trip generations, thus making another retail occupation significantly less likely.

4.10 The impact of the traffic associated with IKEA on local road network has been established and permitted. Any increase in traffic associated with other retail operations on IKEA land would result in an increase in impact on local road network which is not considered or approved. Hence, using IKEA trips as permitted trips is one of the viable solutions.

4.11 Alternatively, employment use could be used given that it is the allocated use and the Council are in fact seeking employment floorspace on IKEA land. Following two scenarios have been tested:

- Scenario 1 - Office (typically)
- Scenario 2 - Parcel distribution centre

4.12 TRICS reports for these scenarios is provided in appendices 3.0 and 4.0 and the trip rates and resultant trips associated with a floor space of 32,900sqm is summarised in Table 4B.

Table 4B Employment Floorspace

		Trip rates		Vehicle Trips		
		In	Out	In	Out	2-Way
Offices	AM Peak Hr	1.752	0.159	577	52	629
	PM Peak Hr	0.108	1.482	35	487	522
Parcel Distribution Centre	AM Peak Hr	0.067	0.378	22	124	146
	PM Peak Hr	0.378	0.378	124	124	248

4.13 Table 4B shows that office use is the highest trip generator. However, these trips vary significantly from the permitted scenario and as such the traffic impact resulting from these trips has not been considered and/or accepted as part of New Monks Farm planning application.

4.14 It would not be appropriate in planning terms for Shoreham Cement Works project to deliver any improvements required to mitigate traffic impact associated with new Monks Farm site.

4.15 It is therefore ADL's opinion that using IKEA trip rates would be the most reasonable option. It is acknowledged that this is a change to what was discussed at Inception meeting and hence ADL welcomes further discussion on this with WSCC, SDNPA and National Highways.

HELP US TO #RENATURE

SOUTH DOWNS NATIONAL PARK

Proposal: Mixed Use Development

National Highways' Ref: Tracker #14796 and #14797

Dear Mr Pisal,

Thank you for your emails of 8 and 9 September sending your Technical Note 2, and responding to our comments on your Technical Note 1 (ref 5201), respectively. This email contains our comments on both of your emails.

Email of 9-9-21 regarding Trip generation, distribution, and assignment (TN1, dated August 2021)

Thank you for your response to our comments in our email of 8 September. Please see our comments below each point in blue text.

1) Permitted trips will indeed be subtracted from the proposed use to obtain 'net' increase in trip generation. Within our final Transport Study Report, we will include this.

This is accepted and should be clearly documented within the overall trip generation calculations, with the approach taken clearly justified.

2) We are awaiting SDNPA response on what type of leisure use that they envisage to be on site. Once we have a knowledge of this, we will include it in our trip generation assessment. We are also seeking clarification from SDNPA regarding the area proposed for hotel use.

While this approach is accepted, National Highways will not be able to accept the trip rates for the Leisure land use element of Scenario C until we have reviewed them. Therefore the trip rates are not yet agreed.

ACTION: Please provide the necessary TRICS data for E(d) – Leisure use and incorporate it within an updated Technical Note for National Highways to review, or the Transport Study Report if this is to be provided prior to a Transport Assessment for the development.

3) Total trip generation (taking into account school internalised trips) will be considered within our Transport Study Report.

Noted and accepted.

4) With regard to internalised employment trips, we have already provided our evidence in the form of Census data within TN1. We do not consider any further evidence is necessary.

We do not accept a reduction in trips due to internalisation unless this is supported with appropriate evidence. Given the scale of the development proposed in each scenario and the potential difference in the nature of the proposals to the existing land uses surrounding the site, the number of trips which would remain within the SOA based on the 19% 2011 Census calculation could underestimate the level of traffic using the strategic road network in the peak periods.

ACTION: Provide further evidence justifying the use of Census 2011 data for the internalised employment trips, or undertake the assessment assuming no internalised employment trips.

5) Table 5A and 5B provides percentage split of trips that will either be distributed based on Census HBW or MND HBO (residential) and Census HBW and MND NHB (employment). Full trip distribution will be included within the Transport Study Report.

Please can you clearly define and explain the acronyms HBW, HBO and NHB within the Transport Study report to ensure all parties are able to review and understand the analysis undertaken?

ACTION: Define and explained the acronyms HBW, HBO and NHB within the Transport Study report.

6) A CMP would be prepared as part of any future planning application subject to the decision made by the LPA.

Noted and accepted.

Email of 8-9-21 sending Technical Note on committed developments and traffic growth assumptions (TN2, dated September 2021)

Please see below for our comments on this document, which includes advice on certain aspects of the technical work which we would expect to see contained within the resulting Transport Assessment (TA).

Committed Development in Adur & Worthing

The proposed methodology of representing committed developments and Local Plan allocations within overall growth for small to medium sites and to those that lie outside the immediate study area, and flows relating to New Monks Farm and Shoreham Airport developments being added manually is acceptable.

We have been able to reconcile only partially the 2033 TEMPRO adjusted assumptions figures in Table 2A of the Technical Note, as shown in Table 1 below.

Table 1 Review of Table 2a, Technical Note 2

		NH TEMPRO 2018 Base	Adjusted Assumptions		Difference
			NH Calculation	ADL Figure (TN2 Table 2a)	
Adur	Homes	28912	30644	30665	-21
	Jobs	26549	27141	27051	90
Worthing	Homes	49849	52169	52179	-10
	Jobs	59258	62432	62432	0

Given that the differences identified are very minor, we assume this is due to slight differences in TEMPRO datasets or rounding errors and consider this is unlikely to have any material impact on the overall assessment. Your adjusted TEMPRO assumptions are therefore accepted.

Committed Developments In South Downs National Park Authority

The assumption that most committed developments within Appendix 2.0 would not require a Transport Assessment or Statement and therefore will be accounted for in the non-adjusted TEMPRO growth factors is accepted.

New Monks Farm and Shoreham Airport Developments

We have reviewed the analysis undertaken to identify the most appropriate trip rates for the assessment of the land previously expected to be occupied by Ikea at the New Monks Farm site. We consider that, although Adur and Worthing Council are seeking employment floorspace on the land, unless a planning application has been made, then the current permitted use is still the consented development which includes the Ikea store. Therefore, the level of trips and impacts which other schemes should be tested against includes the consented development with Ikea.

However, given the intentions of the local authority, please also undertake an appropriate sensitivity test of the highest trip generation scenario if the land is assumed to be for employment use. Please obtain further details from the local authority regarding the maximum quantum of employment use. The assumed employment type needs to be the highest case for trip rate generation. Please consult us on your assumptions for trip generation, distribution and assignment. We note your comments regarding the trip rates for the employment space at the Shoreham Airport site, however these trip rates need to be presented to us for review so that we may ascertain whether they are appropriate for the New Monks Farm site.

ACTION: For the New Monks Farm site, the consented use (Ikea store) should be tested. Also a sensitivity test of the land being used for employment use is required, and appropriate evidence submitted for our review.

Thank you for the information you have provided in advance of this planning application. We appreciate early engagement with developers and look forward to continuing to work with you.

If you have any queries, and to send us further information, please contact us at planningse@highwaysengland.co.uk.

Kind regards,

Elizabeth Cleaver, Assistant Spatial Planning Manager

Subject: FW: National Highways response: Shoreham Cement Works, Steyning Road, Upper Beeding BN44 3TX

Good Morning David

Thank you for your response.

As per your email, I note that our methodology for assessing impact of Monks Farm has now been agreed by Highways England. We will proceed on this basis.

With regard to D2 leisure use, you state:

"This approach is over simplistic, a review of the website for Zip World shows that the number of 'Adventures' (activities) available varies between each site, ranging from 2 to 6. This could mean that the site with 6 Adventures available could be potentially three times busier than the site with only 2 Adventures available. Further consideration is required for a robust assessment."

Based on the above, we understand that out of the 4 Zip World sites, Aberdare has 2 Adventures, Fforest has 6 Adventures, Slate Caverns has 4 Adventures and Penhryn Quarry has 4 Adventures. Therefore, overall, Zip World has 16 Adventures across all their 4 sites. Fforest has the most number of Adventures i.e., 6 and this equates to 37.5% of the total number of Adventures.

It would not be unreasonable to assume that the number of visitors to each site would be more or less proportional to the number of Adventures in each site. Therefore, out of the total 400K visitors, Fforest site could attract 400K x 0.375 = 150K visitors.

"How have these assumptions regarding average car/coach occupancy, and the split between the two, been derived?"

Until we undertake detailed traffic surveys at Zip World, we would not be able to determine the exact mode split. Whilst the COVID restrictions are lifted, we are of the view that certain sites may continue to operate at less capacity than pre-COVID times and hence it would not be appropriate to undertake traffic surveys in 2021. Furthermore, the submission of transport study timescales would not provide us sufficient time to undertake the survey and analysis. We would however recommend within our transport study that any future planning application(s) associated with the D2 use would need to be accompanied by a detailed traffic survey at a comparable site.

In 2016/17, ADL assisted a development proposals in Ashford (Kent) for a tourist attraction based on a model railway. Whilst I appreciate that this facility is quite different to what is being proposed on Shoreham Cement Works, it still provides some proxy for mode split given that it is a destination that would attract tourist. For this site, Kent County Council suggested that mode split based on 60% cars, 40% coach/train should be used as sensitivity test.

We have used Ashford site purely to come up with assumptions for mode split. On the basis that the site is remote from any major public transport facility, our assumption based on 80% arriving by car and 20% by coach is robust.

APPENDIX 1.7
NATIONAL HIGHWAYS COMMENTS ON LEISURE USE TRIPS

With regard to occupancies, given the leisure use of the site, it would not be unreasonable to assume an occupancy of 3 people per car. Coach capacities vary from 38 to 79 depending on various size of the coaches. Hence, coach occupancy of 50 people per coach is considered to be a reasonable assumption.

Kind regards

Dear Amol,

Thank you for your email 6 October 2021 responding to the comments we made on 30 September 2021. Please see below our further comments in blue text in relation to your email.

Email dated 6 October 2021 RE: National Highways response: Shoreham Cement Works, Steyning Road, Upper Beeding

New Monks Farm

Following my email to you of 1st October, we had a meeting with Moira Hayes - Adur Planning Policy Manager to discuss New Monks Farm.

We agreed that IKEA trips are the consented trips and therefore these should be tested.

With regard to alternative employment use on IKEA land, Moira advised that we should use the employment assumptions that were tested within Local Plan modelling. For this, Moira directed us to the Second Addendum Revised Reissue September 2016. Please see Moira's email attached for reference.

Based on that email, for the purpose of Shoreham Cement Works transport study, we will use the employment breakdown for New Monks Farm as:

- B1 - 333 jobs
- B2 – 143 jobs
- B8 – 0 jobs

I note that Tables 2.7 and 2.8 of Second Addendum Revised Reissue September 2016 provide trip generation for New Monks Farm site. However, this trip generation includes both 600 homes and the employment uses all in one. Subtracting residential trips based on trip rates for residential element (provided in Table 2.6), we were able to separate out the employment trip generation as follows:

	In	Out
AM peak hour	132	14
PM peak hour	9	107

As can be seen, the employment trips in the AM peak are significantly higher than IKEA trips and vice versa is true during PM peak.

Hence, we have decided to go with the following for representing New Monks Farm's non-residential element for our Shoreham Transport Study project:-

- For AM peak hour = we will use employment trips i.e., 132 inbound and 14 outbound
- For PM peak hour = we will use IKA trips i.e., 171 inbound and 180 outbound (taken from Vectos' Joint TA)

This approach is accepted.

With regard to D2 Leisure use on site, following is our methodology:-

The land owner's aspiration with regard to D2 use, we have done some background research on Zip World in North Wales. Zip World has 4 sites in Wales (Zip World Fforest in Betws-y-Coed, Zip World Penrhyn Quarry in Bethesda, Zip World Slare Caverns in Blaenau Ffestiniog and Zip World Tower in Aberdare). Having reviewed the research report by North Wales Tourism (see attached), it appears that since its inception (year 2011), Zip World attracted over 1 million visitors by the year 2018. Therefore, this equates to approximately 125K visitors per year.

However, in 2019, online media sources confirmed that the number of visitors increased to 400K in 2018 across all their sites. Based on this, an average of 100K visitors per year per site could be calculated. In our experience, this is a robust assessment to calculate trip generation.

This approach is over simplistic, a review of the website for Zip World shows that the number of 'Adventures' (activities) available varies between each site, ranging from 2 to 6. This could mean that the site with 6 Adventures available could be potentially three times busier than the site with only 2 Adventures available. Further consideration is required for a robust assessment.

ACTION: Provide further evidence to justify the anticipated number of visitors per year for the proposed site.

For the purposes of trip generation, we will be making the following assumption:

- Average car occupancy = 3 visitors per car
- Average coach occupancy = 50 visitors per coach

- 80% would arrive in cars and the remaining 20% by coach

How have these assumptions regarding average car/coach occupancy, and the split between the two, been derived?

Action: Supporting evidence in relation to average occupancy and split between cars/coaches to be provided for National Highways to review.

- For robust assessment, 30-week activity period (Zip World is open for more than this period).

Based on the above assumptions, I calculate the following:

- 80,000 visitors in cars OR 26,667 cars per year OR 890 cars per week OR 127 cars per day
- 20,000 visitors in coach OR 400 coaches per year OR 13 coaches per week OR 2 coaches per day

These figures are not accepted due to outstanding issues already commented upon above regarding total trip numbers, average vehicle occupancy and vehicle split.

Furthermore, whilst a 30-week activity period is to be assessed, there are likely to be peaks within that 30-week period, for example, during school holidays. This should be taken into account in order for the assessment to be robust.

Action: Potential peak activity periods, such as during school holidays, should be assessed.

There is likely that some proportion of trips would arrive later in the day and stay on site in the proposed hotel, to spend the next day at the leisure facility; whilst a large number of people would spend between half to full day on site, depending on the leisure activities.

In order to gauge the arrival departure profile for a weekday, we tested various land uses on TRICS. Both Guy and us at ADL discounted the use of Leisure Park, because leisure park sites in TRICS included multiplex cinemas, multiple restaurants usually including a drive-through and most of them include bowling centres which resulted in a heavy emphasis on evening use.

Having tested Leisure Centre uses on site as per Guy's suggestions, we agreed that leisure centre use produces a more suitable daily profile than the leisure park use. Leisure Centres admittedly differ from the proposed use in that their use is heavily based on swimming pools. However, the pattern of their usage in terms of times of day and length of stay may be reasonably similar, albeit there is still significant evening use, but earlier in the evening than the leisure park developments.

I have attached the leisure centre arrival/departure profile from TRICS that Guy has sent us. Only edge of town sites with extended the date range to obtain a sample of six sites were chosen.

We propose that we would use the arrival/departure pattern obtained from leisure centre use and distribute the proposed Leisure use trips discussed above (i.e., 127 cars inbound and 127 cars

outbound on a daily) to determine the traffic associated with the proposed D2 Leisure Use during AM and PM peak hours.

This approach is not currently accepted. Further evidence is to be provided to demonstrate that the arrival/departure pattern for a leisure centre is similar to that of Zip World, if that is the proposed use for the D2 leisure use. Arrivals and departures to a typical leisure centre would be expected to be fairly evenly dispersed whereas for Zip World, set times are booked in advance for each activity and this will mean large numbers of arrivals and departures at the same times, which would have a greater impact.

ACTION: Further information regarding the nature of the proposed D2 development to be submitted for review, including expected arrival/departure patterns.

Conclusion

As detailed above, a number of issues have been identified which will require further consideration and additional information to be submitted for review, either as part of a further pre-application consultation, or within the TA report to accompany the proposed planning application.

We look forward to continuous engagement with the project and being consulted as the proposals develop.

Thank you again for consulting at the pre-application stage with National Highways. If you have any queries, please do not hesitate to contact us at planningse@highwaysengland.co.uk

Kind regards

David

Subject: RE: National Highways response: Shoreham Cement Works, Steyning Road, Upper Beeding

Hi Elizabeth

This is a further email on New Monks Farm following meeting with Moira Hayes and proposed D2 Leisure Use Trip Generation.

New Monks Farm

Following my email to you of 1st October, we had a meeting with Moira Hayes - Adur Planning Policy Manager to discuss New Monks Farm.

We agreed that IKEA trips are the consented trips and therefore these should be tested.

With regard to alternative employment use on IKEA land, Moira advised that we should use the employment assumptions that were tested within Local Plan modelling. For this, Moira directed us to the Second Addendum Revised Reissue September 2016. Please see Moira's email attached for reference.

Based on that email, for the purpose of Shoreham Cement Works transport study, we will use the employment breakdown for New Monks Farm as:

- B1 - 333 jobs
- B2 – 143 jobs
- B8 – 0 jobs

I note that Tables 2.7 and 2.8 of Second Addendum Revised Reissue September 2016 provide trip generation for New Monks Farm site. However, this trip generation includes both 600 homes and the employment uses all in one. Subtracting residential trips based on trip rates for residential element (provided in Table 2.6), we were able to separate out the employment trip generation as follows:

	In	Out
AM peak hour	132	14
PM peak hour	9	107

As can be seen, the employment trips in the AM peak are significantly higher than IKEA trips and vice versa is true during PM peak.

Hence, we have decided to go with the following for representing New Monks Farm's non-residential element for our Shoreham Transport Study project:-

- For AM peak hour = we will use employment trips i.e., 132 inbound and 14 outbound
- For PM peak hour = we will use IKA trips i.e., 171 inbound and 180 outbound (taken from Vectos' Joint TA)

With regard to **D2 Leisure use** on site, following is our methodology:-

The land owner's aspiration with regard to D2 use, we have done some background research on Zip World in North Wales. Zip World has 4 sites in Wales (Zip World Fforest in Betws-y-Coed, Zip World Penrhyn Quarry in Bethesda, Zip World Slare Caverns in Blaenau Ffestiniog and Zip World Tower in Aberdare). Having reviewed the research report by North Wales Tourism (see attached), it appears that since its inception (year 2011), Zip World attracted over 1 million visitors by the year 2018. Therefore, this equates to approximately 125K visitors per year.

However, in 2019, online media sources confirmed that the number of visitors increased to 400K in 2018 across all their sites. Based on this, an average of 100K visitors per year per site could be calculated. In our experience, this is a robust assessment to calculate trip generation.

For the purposes of trip generation, we will be making the following assumption:

- Average car occupancy = 3 visitors per car
- Average coach occupancy = 50 visitors per coach

- 80% would arrive in cars and the remaining 20% by coach

- For robust assessment, 30-week activity period (Zip World is open for more than this period).

Based on the above assumptions, I calculate the following:

- 80,000 visitors in cars **OR** 26,667 cars per year **OR** 890 cars per week **OR** 127 cars per day
- 20,000 visitors in coach **OR** 400 coaches per year **OR** 13 coaches per week **OR** 2 coaches per day

There is likely that some proportion of trips would arrive later in the day and stay on site in the proposed hotel, to spend the next day at the leisure facility; whilst a large number of people would spend between half to full day on site, depending on the leisure activities.

In order to gauge the arrival departure profile for a weekday, we tested various land uses on TRICS. Both Guy and us at ADL discounted the use of Leisure Park, because leisure park sites in TRICS included multiplex cinemas, multiple restaurants usually including a drive-through and most of them include bowling centres which resulted in a heavy emphasis on evening use.

Having tested Leisure Centre uses on site as per Guy's suggestions, we agreed that leisure centre use produces a more suitable daily profile than the leisure park use. Leisure Centres admittedly differ from the proposed use in that their use is heavily based on swimming pools. However, the pattern of their usage in terms of times of day and length of stay may

be reasonably similar, albeit there is still significant evening use, but earlier in the evening than the leisure park developments.

I have attached the leisure centre arrival/departure profile from TRICS that Guy has sent us. Only edge of town sites with extended the date range to obtain a sample of six sites were chosen.

We propose that we would use the arrival/departure pattern obtained from leisure centre use and distribute the proposed Leisure use trips discussed above (i.e., 127 cars inbound and 127 cars outbound on a daily) to determine the traffic associated with the proposed D2 Leisure Use during AM and PM peak hours.

Kind regards

Subject: RE: National Highways response: Shoreham Cement Works, Steyning Road, Upper Beeding

Dear Elizabeth

Thank you for your comments.

It appears that we have a resolution on a number of items that we have put forward with our TN1 and TN2.

The items that remain to be further discussed are:

1. Internalised employment trips
2. New Monks Farm – non-residential element

With regard to internalised employment trips, given the scale and size of the developments, it is highly likely that there will be a small proportion of residents who live on site would find work within the proposed employment uses. Apart from Census 2011, we currently do not have any other evidence. Whilst we still consider our assumption is robust, especially, this result in discounting no more than 15 trips in the peak hours in the busiest scenario, in order to achieve a resolution, we would agree to not applying any internalisation.

On the matter of New Monks Farm, I note that you agree that IKEA trips should be tested as consented trips. I also note that you require us to undertake sensitivity test by using employment uses. After an internal discussion, we have decided that we will not be undertaking any sensitivity test for New Monks Farm, other than using IKEA trips. This is because the traffic impact of IKEA trips have been considered and accepted; and mitigation measures being implemented. Impact of any other uses on New Monks Farm should have no bearing on Shoreham Cement Works assessment; given that we are undertaking traffic impact study of development scenarios at Shoreham Cement Works and not at New Monks Farm.

Kind regards

Proposal: Mixed Use Development

National Highways' Ref: Tracker #14796 and #14797

Dear Mr Pisal,

Thank you for your emails of 8 and 9 September sending your Technical Note 2, and responding to our comments on your Technical Note 1 (ref 5201), respectively. This email contains our comments on both of your emails.

Email of 9-9-21 regarding Trip generation, distribution, and assignment (TN1, dated August 2021)

Thank you for your response to our comments in our email of 8 September. Please see our comments below each point in blue text.

1) Permitted trips will indeed be subtracted from the proposed use to obtain 'net' increase in trip generation. Within our final Transport Study Report, we will include this.

This is accepted and should be clearly documented within the overall trip generation calculations, with the approach taken clearly justified.

2) We are awaiting SDNPA response on what type of leisure use that they envisage to be on site. Once we have a knowledge of this, we will include it in our trip generation assessment. We are also seeking clarification from SDNPA regarding the area proposed for hotel use.

While this approach is accepted, National Highways will not be able to accept the trip rates for the Leisure land use element of Scenario C until we have reviewed them. Therefore the trip rates are not yet agreed.

ACTION: Please provide the necessary TRICS data for E(d) – Leisure use and incorporate it within an updated Technical Note for National Highways to review, or the Transport Study Report if this is to be provided prior to a Transport Assessment for the development.

3) Total trip generation (taking into account school internalised trips) will be considered within our Transport Study Report.

Noted and accepted.

4) With regard to internalised employment trips, we have already provided our evidence in the form of Census data within TN1. We do not consider any further evidence is necessary.

We do not accept a reduction in trips due to internalisation unless this is supported with appropriate evidence. Given the scale of the development proposed in each scenario and the potential difference in the nature of the proposals to the existing land uses surrounding the site, the number of trips which would remain within the SOA based on the 19% 2011 Census calculation could underestimate the level of traffic using the strategic road network in the peak periods.

ACTION: Provide further evidence justifying the use of Census 2011 data for the internalised employment trips, or undertake the assessment assuming no internalised employment trips.

5) Table 5A and 5B provides percentage split of trips that will either be distributed based on Census HBW or MND HBO (residential) and Census HBW and MND NHB (employment). Full trip distribution will be included within the Transport Study Report.

Please can you clearly define and explain the acronyms HBW, HBO and NHB within the Transport Study report to ensure all parties are able to review and understand the analysis undertaken?

ACTION: Define and explained the acronyms HBW, HBO and NHB within the Transport Study report.

6) A CMP would be prepared as part of any future planning application subject to the decision made by the LPA.

Noted and accepted.

Email of 8-9-21 sending Technical Note on committed developments and traffic growth assumptions (TN2, dated September 2021)

Please see below for our comments on this document, which includes advice on certain aspects of the technical work which we would expect to see contained within the resulting Transport Assessment (TA).

<u>Committed Development in Adur & Worthing</u>

The proposed methodology of representing committed developments and Local Plan allocations within overall growth for small to medium sites and to those that lie outside the immediate study area, and flows relating to New Monks Farm and Shoreham Airport developments being added manually is acceptable.

We have been able to reconcile only partially the 2033 TEMPRO adjusted assumptions figures in Table 2A of the Technical Note, as shown in Table 1 below.

Table 1 Review of Table 2a, Technical Note 2

		NH TEMPRO 2018 Base	Adjusted Assumptions		Difference
			NH Calculation	ADL Figure (TN2 Table 2a)	
Adur	Homes	28912	30644	30665	-21
	Jobs	26549	27141	27051	90
Worthing	Homes	49849	52169	52179	-10
	Jobs	59258	62432	62432	0

Given that the differences identified are very minor, we assume this is due to slight differences in TEMPRO datasets or rounding errors and consider this is unlikely to have any material impact on the overall assessment. Your adjusted TEMPRO assumptions are therefore accepted.

Committed Developments In South Downs National Park Authority

The assumption that most committed developments within Appendix 2.0 would not require a Transport Assessment or Statement and therefore will be accounted for in the non-adjusted TEMPRO growth factors is accepted.

New Monks Farm and Shoreham Airport Developments

We have reviewed the analysis undertaken to identify the most appropriate trip rates for the assessment of the land previously expected to be occupied by Ikea at the New Monks Farm site. We consider that, although Adur and Worthing Council are seeking employment floorspace on the land, unless a planning application has been made, then the current permitted use is still the consented development which includes the Ikea store. Therefore, the level of trips and impacts which other schemes should be tested against includes the consented development with Ikea.

However, given the intentions of the local authority, please also undertake an appropriate sensitivity test of the highest trip generation scenario if the land is assumed to be for employment use. Please obtain further details from the local authority regarding the maximum quantum of employment use. The assumed employment type needs to be the highest case for trip rate generation. Please consult us on your assumptions for trip generation, distribution and assignment. We note your comments regarding the trip rates for the employment space at the Shoreham Airport site, however these trip rates need to be presented to us for review so that we may ascertain whether they are appropriate for the New Monks Farm site.

ACTION: For the New Monks Farm site, the consented use (Ikea store) should be tested. Also a sensitivity test of the land being used for employment use is required, and appropriate evidence submitted for our review.

Thank you for the information you have provided in advance of this planning application. We appreciate early engagement with developers and look forward to continuing to work with you.

If you have any queries, and to send us further information, please contact us at planningse@highwaysengland.co.uk.

Thank you Amol

This does seem to me a good way forward. The reporting will have to explain that although the trip rates are based largely on swimming pools, whilst none is proposed for the site, we consider that it makes for a suitable proxy for the types of leisure proposed on site, in terms of arrival/departure profiles and some flexibility on hours of operation.

Kind regards

Hi Guy

I agree with your assessment. In fact, we were also inclined to go with leisure centre use in the first instance; however, due to differences in their use with the proposed use, we discounted this.

On hind sight, I consider using the arrival departure profile for leisure centre uses and distributing the trips accordingly would provide us with a more appropriate results.

The daily number of vehicular trips would be based up on original assumption of 100K visitors per year to the leisure use. @Lucy and @Alex, please could you confirm if this is a correct assumption to move forward?

Thank you.

Kind regards

APPENDIX 1.8
WEST SUSSEX COUNTY COUNCIL COMMENTS ON LEISURE USE TRIPS

From: Guy Parfect <guy.parfect@westsussex.gov.uk>
Sent: 01 October 2021 13:24
To: Amol Pisal <Amol@adltraffic.co.uk>; Lucy Howard <Lucy.Howard@southdowns.gov.uk>; Alex Pringle <Alex.Pringle@southdowns.gov.uk>; Olamide Olayinka <Olamide.Olayinka@westsussex.gov.uk>
Cc: Alex Painting <alex@adltraffic.co.uk>
Subject: RE: Development Scenarios

Hi Amol

I have examined the TRICS rates which you have provided. The leisure park sites are showing a heavy emphasis on evening use, including late evenings. Looking at the development units included in these sites they all include multiplex cinemas, multiple restaurants usually including a drive-through and most of them include bowling centres. Three of the six selections include either a nightclub or poker club which is only open late evening/night. More day-based activity such as health and fitness centre is in the minority.

Whilst the 80% am arrivals previously suggested was too much, I now think that we have gone too far the other way with only 2.4% of arrivals in AM peak and arrivals considerably outweighing departures in PM, so there is a need to move towards centre ground.

Having made a comparison, I think the leisure centre use produces a more suitable daily profile than the leisure park use. Admittedly the leisure centre is heavily based around swimming pools, which is not what is proposed, but I think the pattern of use in terms of times of day and length of stay may be reasonably similar, albeit there is still significant evening use, but earlier in the evening than the leisure park developments. The intensity of daily and peak use, I also don't think is out of step; it should produce a robust PM peak assessment. I've attached trip rate graphs of both uses for comparison. For leisure centre I also chose only edge of town sites and extended the date range to obtain a sample of six sites. This meant accepting sites from 2009 whereas the leisure park date range went back to 2000.

I do have to caveat by saying I do not know what National Highways view will be of this matter.

Could you let me know your thoughts on this response?

Kind regards

Guy

Subject: RE: Development Scenarios

Hi Guy

Having reviewed our assumptions for D2 use, I have reverted back to TRICS database to determine a typical arrival/departure profile between the hours of 08:00 and 18:00. This is because places like Zipworld are open to public between 09:00 and 17:00 hours.

The closest comparable sub-land use within TRICS is Leisure Park. I attach the TRICS report for you reference. I have also attached spreadsheet which shows the arrival/departure profile based on TRICS between the hours of 08:00 – 18:00 only (in Columns L to N).

It clearly shows that mid-afternoon is the busiest time, there appear to be vehicles arriving in the late afternoon hours also. This is attributed to the fact that some Leisure Parks are open till late night hours.

In our case, if we are to use the same arrival/departure profile between 08:00 and 18:00 hours, the busy hours of late afternoon could be attributed towards those who arrive on site to stay overnight before their main visit the next day.

I think, using this methodology would address your concerns regarding our previous arrival departure assumptions.

Please let me know your thoughts.

Thank you.

Kind regards

Subject: RE: Development Scenarios

Hi Amol and all

I'm sorry that this has taken several days to respond to, due largely to one of those weeks where every time this reached the top of my to-do list, something else has come up that has had to receive attention.

I agree that 7500sqm / 116 beds is a more realistic size for a hotel than 37500sqm / 621 beds which would seem to be a size which would exceed what could be filled by the likely demand through most if not all of the year in this location. The larger size would also raise questions about the amount of parking needed to be provided on site, given that we can expect mode share by public transport to be low for this use (even taking into account rail plus taxi from Shoreham rather than bus).

I took a look at the Zip-World website earlier this week to inform myself on their operation. A couple of things which I picked up were:

1) Each of their four sites seems to have three or four activities which together can make up a full day visit; an individual activity typically lasts for two to three hours and they are purchasable individually.
2) The overnight accommodation offered on their website was not on site; it was linking to accommodation around the local area or region.
3) The sites seemed to be open seven days a week

You have calculated average daily usage; the demand is likely to have a seasonal profile, but we are assessing on the basis of neutral months for traffic so a straight annual average would fit in with this. However it may also be sensible to think about seasonal summer demands for sensitivity, as the seasonal peak for leisure use may also coincide with busy times for general traffic – more so in June and July than in August when there is a low in the commuter peaks which you are assessing but strong demand in the inter-peak.

It will be helpful in the tech note and report to set out the rationale or evidence to back any assumptions made and to state where there is a shortfall in available evidence (empirical or otherwise) to support any assumptions, so that we can take into account the extent of uncertainty in subsequent analysis.

For example the proposed split of 80% car and 20% coach (implying negligible use of service bus, taxi or cycle) seems broadly reasonable to me, but I'd like to know if this is based on typical figures recorded from other leisure attractions.

Ref "Typically, 10% of the daily trips occur during AM and PM peak hours. However, for the purposes of robust assessment, we are assuming that 80% of the visitors arrive in the AM peak hour i.e., there would be 102 cars and 2 coaches would arrive in the AM peak hour.

The attached North Wales Tourism report also shows 75% trips of the visitors stayed at least one night and the remaining 25% trips left the same day."

I think that the 80% arriving in the AM peak hour is likely to be a significant over-estimate for a few reasons:

1) Not every day visit will be a full day visit. If there is one zip-wire activity on site we would expect a stay around three hours; if there are several activities, as at Zip-World, a large proportion of visits may be for a full day, but there may be others doing a half day
2) Arrivals for a leisure activity, even if based on a full day may be as likely to arrive after 9am as before.
3) Those staying overnight at the hotel on site are at least as likely to be staying over the night before their main visit as the night afterward
4) The figures in the tourism report stated "Citing their main motivation to visit North Wales as Zip World, 74.74% of responders stated that they stayed for at least one night, and by definition, became tourists. This provides strong reason to believe that Zip World is a strong tourism generator for North Wales." This seems to to be addressing those visitors to Zip-World who stated that Zip-World was their mean reason for visiting North Wales and that the proportions would be within that group, rather than also being representative of other groups such as those who were already visiting the area for a longer stay and only decided to visit Zip-World when they were already in North Wales, or local day visitors who already lived in North Wales. It also seems to me that for the Shoreham Cement Works there is a larger catchment of local residents (say within two

hours car travel time of the site) who may choose to visit than there would be for the North Wales sites, where the local settlements are relatively small and a high proportion of visitors will be coming from north-west England or the west Midlands.

Please could you consider these points and respond as to whether you wish to make any changes to your proposed arrival and departure profiles in response?

Kind regards

Guy

Cc: Alex Painting <alex@adltraffic.co.uk>
Subject: RE: Development Scenarios

Hi Lucy

Thank you for your response.

C1 Hotel Use

Using TRICS database, it appears that average size of a hotel is 6,911 sqm and average number of bedrooms per hotel is 116. See the list of hotels, their GFAs and number of bedrooms provided in the attached spreadsheet.

Therefore, based on this, we calculate a hotel with a total GFA of 37,000 sqm (Scenario C) could accommodate a whopping 621 bedrooms.

Scenarios A and B which provide a 7,500 sqm of hotel is a realistic figure based on the above. But, as you say, given that 37,000 sqm of C1 use (hotel) has been given to other consultants for Scenario C, we would be happy to test this.

D2 Leisure Use

@Guy, now that Lucy has confirmed the land owner's aspiration with regard to D2 use, we have done some background research on Zip World in North Wales. Zip World has 4 sites in Wales (Zip World Fforest in Betws-y-Coed, Zip World Penrhyn Quarry in Bethesda, Zip World Slare Caverns in Blaenau Ffestiniog and Zip World Tower in Aberdare). Having reviewed the research report by North Wales Tourism (see attached), it appears that since its inception (year 2011), Zip World attracted over 1 million visitors by the year 2018. Therefore, this equates to approximately 125K visitors per year.

However, in 2019, online media sources confirmed that the number of visitors increased to 400K in 2018 across all their sites. Based on this, an average of 100K visitors per year per site could be calculated. In my experience, this is a robust assessment to calculate trip generation.

For the purposes of trip generation, I will be making the following assumption:

- Average car occupancy = 3 visitors per car
- Average coach occupancy = 50 visitors per coach

- 80% would arrive in cars and the remaining 20% by coach

- For robust assessment, 30-week activity period (Zip World is open for more than this period).

Based on the above assumptions, I calculate the following:

- 80,000 visitors in cars **OR** 26,667 cars per year **OR** 890 cars per week **OR** 127 cars per day
- 20,000 visitors in coach **OR** 400 coaches per year **OR** 13 coaches per week **OR** 2 coaches per day

Vehicle Arrivals

Typically, 10% of the daily trips occur during AM and PM peak hours. However, for the purposes of robust assessment, we are assuming that 80% of the visitors arrive in the AM peak hour i.e., there would be 102 cars and 2 coaches would arrive in the AM peak hour.

The attached North Wales Tourism report also shows 75% trips of the visitors stayed at least one night and the remaining 25% trips left the same day.

Therefore, out of the 102 cars and 2 coaches that arrive during AM peak hour, 26 cars and 1 coach would depart in the PM peak hour and the remaining 76 cars and one coach would be parked within the development i.e., visitors staying at the proposed hotel. These 76 cars and 1 coach are assumed to depart the next day during AM peak hour.

Therefore, the arrival departure profile for this use during AM and PM peak hours would be as follows:

	In	Out	Two-way
AM Peak Hour	102 cars + 2 coaches	76 cars + 1 coach (from previous day)	178 cars + 3 coaches
PM Peak Hour	0	26 cars + 1 coach	26 cars + 1 coach

76 cars and 1 coach trips will be discounted from the hotel trip generation during AM peak hours (inbound and outbound) to avoid any double-counting in Scenario C.

Thank you.

Kind regards

Subject: RE: Development Scenarios

Hi Amol

Thank you for the email. I have talked about this with Alex so apologies if we have not got back to you before.

I agree that the 37,000 m2 for a hotel is very large. However, we have given all the same figures to all the consultants and so I think you should test it. I think we need to give some thought to a more realistic figure and test it as another scenario. Have you got any floorspace figures for hotels that you could share?

In regard to the 18,500 m2 for D2 Assembly & Leisure I can confirm that this is the correct figure to test. His could be any other indoor or outdoor sports or recreations (not involving motorised vehicles or firearms). Last time I was on site with the site owner who was talking about a zip wire as per Zip World in Snowdonia.

Kind regards

Lucy Howard

Subject: Development Scenarios

Dear Alex and Lucy

I was wondering if you could please confirm that the proposed 37,00 sqm of C1 use (hotel) and 18,500 sqm of D2 (leisure) is realistic and correct?

Also, with regard to the D2 use, there are a number of sub-land uses. I would expect that given the remaining proposed land uses, D2 is likely to be a leisure centre?

I look forward to your comments.

Thank you.

TECHNICAL NOTE 3
SHOREHAM CEMENT WORKS
JUNCTION CAPACITY ASSESSMENT
(ADL REF: 5201, 15th NOVEMBER 2021)
REVISION A

INTRODUCTION

1.0 Scope of Study

1.1 ADL Traffic & Highways Engineering Ltd have been commissioned by South Downs National Park Authority (SDNPA) to undertake a transport study of the development scenarios at Shoreham Cement Works.

1.2 This Technical Note 3 (TN3) summarises the junction capacity assessment of the four development scenarios at the each of the junctions subject to this transport study.

1.3 This TN4 is supplemented by previous Technical Notes which are as follows:

- TN1: Trip Generation, Trip Distribution, Trip Assignment Methodology;
- TN2: Committed Development Assessment; and
- Subsequent discussions with SDNPA, WSCC and NH.

2.0 Junctions Assessed

2.1 As per discussions with West Sussex County Council (WSCC), the Highway Authority, and National Highways (NH), it has been agreed that the following junctions are to be assessed for each of the development scenarios:

1) A283 / A24 (Washington) Roundabout;
2) A283 / Water Lane / Chanctonbury Ring Road crossroads;
3) A283 / Maudlin Lane / Clays Hill / Castle Lane / The Street Roundabout;
4) A283 / A2037 Roundabout;
5) Site Access (North); **access arrangement to be agreed**

ADL House, Oaklands Business Park, Armstrong Way, Yate, Bristol BS37 5NA | Tel: 01454 332 100 | Email: info@adltraffic.co.uk | Web: www.adltraffic.co.uk
Company No. 3121125 | VAT Registration No. 674 4017 36

6) Site Access (South); **access arrangement to be agreed**

7) A283 / A27 Slips Roundabout;

8) A283 / Upper Shoreham Road Roundabout;

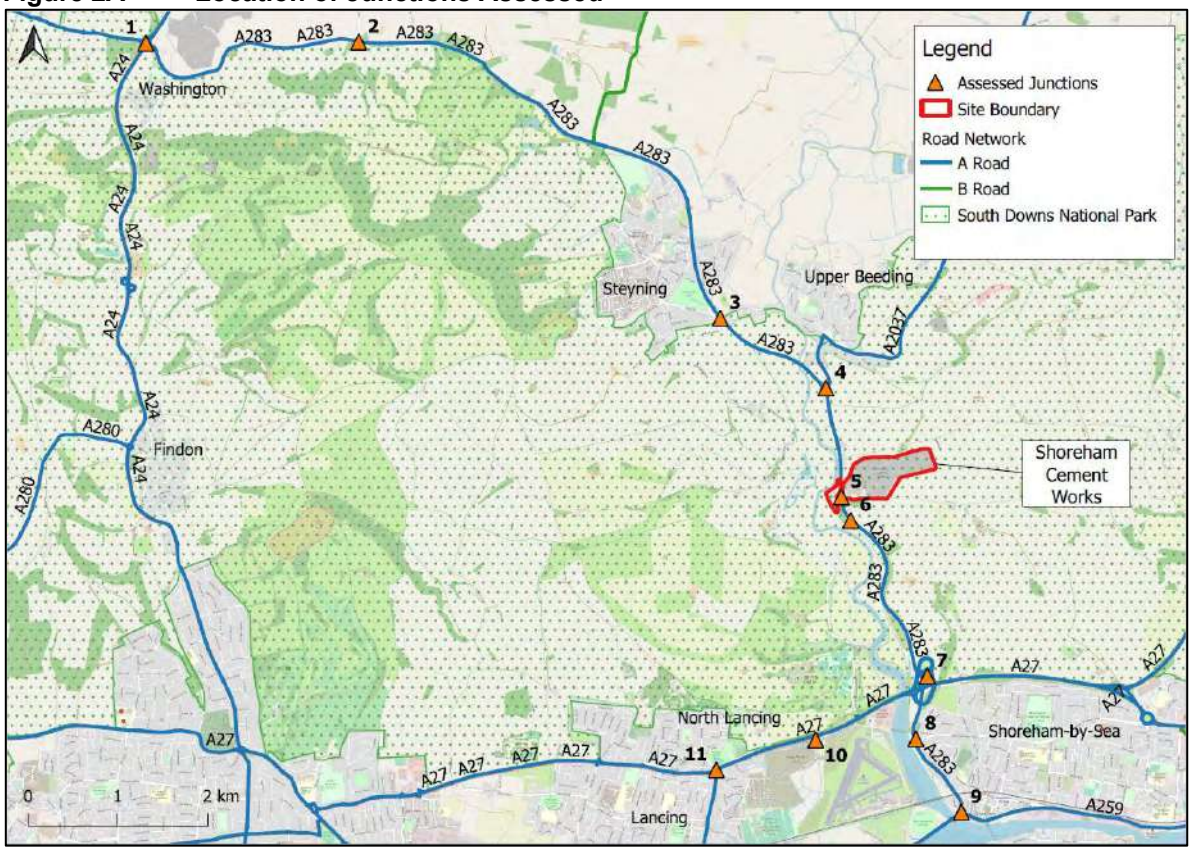
9) A283 / A259 Roundabout;

10) A27 / New Monks Farm Committed Signalised Roundabout; and

11) A27 / A2025 / Manor Road (Lancing Manor) Roundabout.

2.2 A plan of the aforementioned junctions is shown on a plan in Figure 2A.

Figure 2A Location of Junctions Assessed



3.0 Development Scenarios

3.1 There are four development scenarios for the Shoreham Cement Works site which are being assessed as part of this transport study which have been drawn up by SDNPA. These scenarios, and their respective schedule of development, are summarised in Table 3A.

Table 3A Development Scenarios

Current Use Class	Former Use Class	1 Housing / Employment Led	2 Housing / Employment Led	3 Leisure Led	4 Appeal scheme
B2: General industrial	B2	16,200	16,200	0	13,250
B8: Storage or distribution	B8	20,000	20,000	0	13,250
C1: Hotel*	C1	7,500	7,500	7,500	7,500
E(a): Retail	A1	0	0	500	0
E(b): Consumption of food & drink on premises	A3	0	0	1,500	1,500
E(d): Indoor sport, recreation & fitness**	D2	0	0	18,500	0
E(g)(i): Offices	B1(a)	0	0	0	12,000
E(g)(ii): Research & Development / E(g)(iii) Industrial processes	B1 (b/c)	32,000	32,000	32,000	0
F1: Learning & non-residential institution	D1	2,000	2,000	10,000	0
F2(a): Local shop	A1	280	280	280	0
C3: Dwellings	C3	400	240	200	84
Total commercial floorspace		**77,980**	**77,980**	**70,280**	**47,500**
Total homes		**400**	**240**	**200**	**84**

*Possibility of sui generis for hostel
**Possibility of sui generis for live music venue

Notes:
Floorspace of hotel kept constant at 7,500 m2. This is approx equivalent to a 130-bed hotel based on the TRICS database
Floorspace of a local shop kept constant in first 3 scenarios. Floorspace of 280 m2 is the maximum allowed under this use class.
The employment floorspace figure for the appeal scheme has been split equally between B2 and B8
The E(b): Consumption of food & drink on premises in scenario 3 is a pub/restaurant but is not sui generis drinking establishment

JUNCTION CAPACITY ASSESSMENT

4.0 Introduction

4.1 A junction capacity assessment has been undertaken for each of the 11 junctions assessed as part of this transport study for the year 2033.

2033 Baseline Scenario

4.2 Each of the four development scenarios have been tested against the 2033 Baseline Scenario without development (i.e., 2033 Base + Total Committed Development). The methodology for estimating the 2033 Baseline traffic flows has been discussed at length in TN1 and TN2, as well as email correspondence with NH.

4.3 TN1 describes the permitted development for the site and the traffic flows associated with the permitted uses are assumed to be factored into the 2033 Baseline traffic flows.

Proposed Development Scenarios

4.4 Each of the four development scenarios consider the removal of the permitted development. As such, the proposed development scenarios are as follows:

Scenario 1:

- 2033 Base + Total Committed Development – Permitted Development + Scenario 1 Proposed Development

Scenario 2:

- 2033 Base + Total Committed Development – Permitted Development + Scenario 2 Proposed Development

Scenario 3:

- 2033 Base + Total Committed Development – Permitted Development + Scenario 3 Proposed Development

Scenario 4:

- 2033 Base + Total Committed Development – Permitted Development + Scenario 4 Proposed Development

Proposed Development Scenarios with Mitigation

4.5 Should the proposed development scenarios result in the junction not operating within theoretical capacity (i.e., RFC value greater than 0.85), or significant increase in queue lengths when compared with the 2033 baseline scenario, ADL have proposed mitigation in the form of junction improvements to alleviate potential traffic issues identified at certain arms of junctions.

4.6 Any junction improvements have then been remodelled to test the extent to which the improved junction improvements can accommodate the proposed development scenarios without severe residual traffic impact.

4.7 This is to ensure that the proposed development scenarios would not result in an unacceptable impact on highway safety, or cause severe residual cumulative impacts on the road network (National Planning Policy Framework (2021) paragraph 111).

Budget Cost Estimate for Off-Site Highway Works

4.8 Where off-site highways improvements have been proposed as mitigation, a budget cost estimate has been drawn up for each of the affected junctions.

4.9 These is a budget estimate only, which excludes design and council fees, and underground service diversion costs. It has been assumed that the existing road, where retained, will be resurfaced and the whole gyratory has been resurfaced. ADL are not qualified quantity surveyors and the estimates provided should not be used for any contract documents

4.10 Each of the junctions are assessed in the subsequent sections.

5.0 Junction 1 – A283 / A24 (Washington) Roundabout

5.1 The Washington Roundabout, i.e., A283 / A24 junction has been assessed for capacity using TRL's Junction's 9 Software.

Existing Junction Arrangement

5.2 The ARCADY model output for 2033 Baseline Scenario with existing junction arrangement is provided as Appendix 1.1. The results are summarised in Table 5A.

Table 5A ARCADY Outputs: Washington Roundabout – 2033 Baseline Scenario

Arm	AM Peak Hour		PM Peak Hour	
	RFC	Queue	RFC	Queue
A283 East	0.80	4	0.83	5
A24 South	0.86	6	0.63	2
A283 West	1.06	45	0.93	11
A24 North	0.91	9	1.17	162
Total Queue	**-**	**64**	**-**	**180**

5.3 The model output for the Proposed Development Scenarios, under the existing junction arrangement is provided as Appendix 1.2. The results are summarised in Table 5B.

Table 5B ARCADY Outputs: Washington Roundabout – 2033 Total Scenarios, with Existing Junction Arrangement

Scenario	Arm	AM Peak Hour			PM Peak Hour		
		RFC	Queue	Increase in Queue (From 2033 Base)	RFC	Queue	Increase in Queue (From 2033 Base)
1	A283 East	0.83	5	+1	0.84	5	0
	A24 South	0.87	7	+1	0.63	2	0
	A283 West	1.09	57	+12	0.94	12	+1
	A24 North	0.91	9	0	1.18	174	+12
	Total Queue	**-**	**78**	**+14**	**-**	**193**	**+13**
2	A283 East	0.82	4	0	0.85	5	0
	A24 South	0.87	6	0	0.63	2	0
	A283 West	1.08	54	+9	0.94	12	+1
	A24 North	0.91	9	0	1.17	167	+5
	Total Queue	**-**	**73**	**+13**	**-**	**186**	**+6**
3	A283 East	0.82	4	0	0.84	5	0
	A24 South	0.87	6	0	0.63	2	0
	A283 West	1.08	53	+8	0.94	12	+1
	A24 North	0.91	9	0	1.17	168	+6
	Total Queue	**-**	**72**	**+12**	**-**	**187**	**+7**
4	A283 East	0.81	4	0	0.84	5	0
	A24 South	0.87	6	0	0.63	2	0
	A283 West	1.08	52	+7	0.93	11	0
	A24 North	0.91	9	0	1.17	164	+2
	Total Queue	**-**	**71**	**+7**	**-**	**182**	**+2**

* RFC = Ratio of flow to capacity
* Queue = Measured in vehicles

5.4 Table 5B demonstrates that all proposed development scenarios result in an increase in queueing on the A283 West arm of the roundabout during the AM peak hour. The increase in queues is +12 vehicles in Scenario 1; +9 vehicles in Scenario 2; +8 vehicles in Scenario 3; and +7 vehicles in Scenario 4.

5.5 Table 5B also demonstrates that all proposed development scenarios result in an increase in queueing on the A24 North arm of the roundabout during the PM peak hour. The increase in queues is +12 vehicles in Scenario 1; +5 vehicles in Scenario 2; +6 vehicles in Scenario 3; and +2 vehicles in Scenario 4.

Note: The increase in queues is not considered to be significant enough to warrant any improvements to the junction. However, should the Highway Authority consider this to be fully mitigated, junction improvements are suggested below.

Proposed Junction Improvements

5.6 It is proposed to provide the following mitigation to improve the capacity of the junction and minimise the impact of the proposed development scenarios:

A283 West:

- Increase entry width from 8.5 metres to 11.3 metres (i.e., increase from two to three lanes); and
- Lane direction road markings.

A24 North:

- Increase entry width from 8.2 metres to 11.4 metres (i.e., increase from two to three lanes);
- Flare length increased from 4.8 metres to 53 metres; and
- Lane direction road markings – left lane dedicated to left turners, two lanes dedicated for straight ahead and right/U-turners.

A283 East:

- Lane direction road markings.

A24 South:

- Lane direction road markings.

Circulatory lanes:

- Lane direction road markings.

5.7 A plan of the proposed junction improvements are provided as Appendix 1.3. The model output for the Proposed Development Scenarios, with proposed junction improvements is provided as Appendix 1.4. The results are summarised in Table 5C.

Table 5C ARCADY Outputs: A283 / A24 Roundabout – 2033 Total Scenarios, with Proposed Junction Improvements

Scenario	Arm	AM Peak Hour			PM Peak Hour		
		RFC	Queue	Increase in Queue (From 2033 Base)	RFC	Queue	Increase in Queue (From 2033 Base)
1	A283 East	0.84	5	+2	1.01	23	+18
	A24 South	0.88	7	+1	0.65	2	0
	A283 West	0.86	6	-39	0.77	3	-8
	A24 North	0.69	2	-7	0.86	6	-156
	Total Queue	**-**	**20**	**-44**	**-**	**34**	**-146**
2	A283 East	0.83	5	+1	1.02	24	+19
	A24 South	0.88	7	+1	0.64	2	0
	A283 West	0.86	6	-39	0.76	3	-8
	A24 North	0.68	2	-7	0.86	6	-156
	Total Queue	**-**	**20**	**-44**	**-**	**35**	**-145**
3	A283 East	0.83	5	+1	1.01	22	+17
	A24 South	0.88	7	+1	0.64	2	0
	A283 West	0.85	5	-40	0.76	3	-8
	A24 North	0.68	2	-7	0.86	6	-156
	Total Queue	**-**	**19**	**-45**	**-**	**33**	**-147**
4	A283 East	0.82	4	0	1.00	20	+15
	A24 South	0.87	7	+1	0.64	2	0
	A283 West	0.85	5	-40	0.76	3	-8
	A24 North	0.68	2	-7	0.85	6	-156
	Total Queue	**-**	**20**	**-44**	**-**	**31**	**-149**

* RFC = Ratio of flow to capacity
* Queue = Measured in vehicles

5.8 Table 5C demonstrates that the proposed junction improvements would result in significant increase the capacity of the junction.

5.9 Table 5C shows that during the AM Peak Hour, compared to the 2033 Base Scenario, the on the A283 West arm, the decrease in queues is -39 vehicles in Scenario 1 and Scenario 2; and -40 vehicles in Scenario 3 and Scenario 4. In all proposed development scenarios, there would be decrease of -7 vehicles on A24 North arm during AM peak hour.

5.10 Table 5C also shows that during the PM peak hour, in all proposed development scenarios compared to the 2033 Base Scenario, on the A24 North arm there would be decrease of -156 vehicles, and on the A283 West arm there would be decrease of -8 vehicles.

5.11 Whilst the proposed junction improvements do incur an increase in queue lengths on the A283 East arm of the roundabout, during the PM peak hour, the total number of queueing vehicles is significantly decreased compared the 2033 Baseline Scenario in all proposed development scenarios.

Budget Cost Estimate for Off-Site Highway Works

5.12 A summary of the budget cost estimate for the off-site highways works for the proposed junction improvements is provided in Table 5D.

Table 5D Budget Cost Estimate: A283 / A24 Roundabout

Item	Description	£
	Preliminaries 15%	£35,670.00
1.0	Site Clearance Works	£17,786.00
2.0	Earthworks	£58,749.00
3.0	Pavement	£143,267.00
4.0	Drainage	£5,500.00
5.0	Signs and Markings	£12,500.00
6.0	Other	£22,837.50
	Total	**£296,310**
	Contingency 10%	**£29,631**
	Civils Total	**£325,941**

5.13 Full details for the budget cost estimate are provided as Appendix 1.5.

6.0 Junction 2 – A283 / Water Lane / Chanctonbury Ring Road Crossroads

6.1 The A283 / Water Lane / Chanctonbury Ring Road crossroads junction has been assessed for capacity using TRL's Junction's 9 Software.

Existing Junction Arrangement

6.2 The PICADY model output for 2033 Baseline Scenario with existing junction arrangement is provided as Appendix 2.1. The results are summarised in Table 6A.

Table 6A PICADY Outputs: A283 / Water Lane – 2033 Baseline Scenario

Arm	AM Peak Hour		PM Peak Hour	
	RFC	Queue	RFC	Queue
Chanctonbury Ring Road (Left Out)	0.03	0	99999999	2
Chanctonbury Ring Road (Right Out)	0.36	1	99999999	1
A283 East (right turn)	0.56	2	0.47	1
Water Lane (Left Out)	0.69	2	1.11	25
Water Lane (Right Out)	0.13	0	1.03	5
A283 West (right turn)	0.00	0	0.00	0
Total Queue	**-**	**5**	**-**	**34**

6.3 The model output for the Proposed Development Scenarios, under the existing junction arrangement is provided as Appendix 2.2. The results are summarised in Table 6B.

Table 6B PICADY Outputs: A283 / Water Lane – 2033 Total Scenarios, with Existing Junction Arrangement

Scenario	Arm	AM Peak Hour			PM Peak Hour		
		RFC	Queue	Increase in Queue (From 2033 Base)	RFC	Queue	Increase in Queue (From 2033 Base)
1	Chanctonbury Ring Road (Left Out)	0.13	0	0	9999999	2	0
	Chanctonbury Ring Road (Right Out)	0.66	1	0	9999999	1	0
	A283 East (right turn)	0.57	2	0	0.47	1	0

	Water Lane (Right Out)	0.15	0	0	1.09	6	+1
	A283 West (right turn)	0.00	0	0	0.00	0	0
	Total Queue	**-**	**5**	**0**	**-**	**46**	**+12**
2	Chanctonbury Ring Road (Left Out)	0.06	0	0	9999999	2	0
	Chanctonbury Ring Road (Right Out)	0.54	1	0	9999999	1	0
	A283 East (right turn)	0.57	2	0	0.47	1	0
	Water Lane (Left Out)	0.70	2	0	1.16	32	+7
	Water Lane (Right Out)	0.14	0	0	1.07	6	+1
	A283 West (right turn)	0.00	0	0	0.00	0	0
	Total Queue	**-**	**5**	**0**	**-**	**42**	**+8**
3	Chanctonbury Ring Road (Left Out)	0.05	0	0	9999999	2	0
	Chanctonbury Ring Road (Right Out)	0.50	1	0	9999999	1	0
	A283 East (right turn)	0.57	2	0	0.47	1	0
	Water Lane (Left Out)	0.70	2	0	1.16	31	+6
	Water Lane (Right Out)	0.14	0	0	1.06	5	0
	A283 West (right turn)	0.00	0	0	0.00	0	0
	Total Queue	**-**	**5**	**0**	**-**	**40**	**+6**
4	Chanctonbury Ring Road (Left Out)	0.04	0	0	9999999	2	0
	Chanctonbury Ring Road (Right Out)	0.46	1	0	9999999	1	0
	A283 East (right turn)	0.57	2	0	0.47	1	0
	Water Lane (Left Out)	0.69	2	0	1.13	28	+3
	Water Lane (Right Out)	0.14	0	0	1.04	5	0
	A283 West (right turn)	0.00	0	0	0.00	0	0
	Total Queue	**-**	**5**	**0**	**-**	**37**	**+3**

* RFC = Ratio of flow to capacity
* Queue = Measured in vehicles

6.4 Table 6B shows that the junction operates within theoretical capacity (i.e., RFC value of less than 0.85) under all development scenarios, with no increase in queues in the AM peak hour.

6.5 Table 6B also shows that all proposed development scenarios result in an increase in queueing on Water Lane (left out) during the PM peak hour. The increase in queues is +11 vehicles in Scenario 1; +7 vehicles in Scenario 2; +6 vehicles in Scenario 3; and +3 vehicles in Scenario 4.

Note: The increase in queues is not considered to be significant enough to warrant any improvements to the junction. However, should the Highway Authority consider this to be fully mitigated, junction improvements are suggested below.

Proposed Junction Improvements

6.6 It is proposed to provide the following mitigation to improve the capacity of the junction and minimise the impact of the proposed development scenarios:

Water Lane:

- Increase width to 6.0 metres at 10 metres back from give-way, and up to 5.5 metres at 15 metre back from give-way (i.e., increase flare length from two PCU to three PCU); and
- Increase visibility to left onto A283 to 100 metres – WSCC to maintain the vegetation within adopted highway extent.

6.7 A plan of the proposed junction improvements are provided as Appendix 2.3. The model output for the Proposed Development Scenarios, with proposed junction improvements is provided as Appendix 2.4. The results are summarised in Table 6C.

Table 6C PICADY Outputs: A283 / Water Lane – 2033 Total Scenarios, with Proposed Junction Improvements

Scenario	Arm	AM Peak Hour			PM Peak Hour		
		RFC	Queue	Increase in Queue (From 2033 Base)	RFC	Queue	Increase in Queue (From 2033 Base)
1	Chanctonbury Ring Road (Left Out)	0.12	0	0	9999999	2	0
	Chanctonbury Ring Road (Right Out)	0.65	1	0	9999999	1	0
	A283 East (right turn)	0.57	2	0	0.47	1	0
	Water Lane (Left Out)	0.68	2	0	1.15	29	+4
	Water Lane (Right Out)	0.14	0	0	1.05	5	0
	A283 West (right turn)	0.00	0	0	0.00	0	0
	Total Queue	**-**	**5**	**0**	**-**	**38**	**+4**
2	Chanctonbury Ring Road (Left Out)	0.06	0	0	9999999	2	0
	Chanctonbury Ring Road (Right Out)	0.54	1	0	9999999	1	0
	A283 East (right turn)	0.57	2	0	0.47	1	0
	Water Lane (Left Out)	0.68	2	0	1.11	25	0
	Water Lane (Right Out)	0.14	0	0	1.02	5	0
	A283 West (right turn)	0.00	0	0	0.00	0	0
	Total Queue	**-**	**5**	**0**	**-**	**34**	**0**
3	Chanctonbury Ring Road (Left Out)	0.05	0	0	9999999	2	0
	Chanctonbury Ring Road (Right Out)	0.50	1	0	9999999	1	0
	A283 East (right turn)	0.57	2	0	0.47	1	0
	Water Lane (Left Out)	0.68	2	0	1.11	24	-1
	Water Lane (Right Out)	0.13	0	0	1.02	5	0
	A283 West (right turn)	0.00	0	0	0.00	0	0
	Total Queue	**-**	**5**	**0**	**-**	**33**	**-1**
4	Chanctonbury Ring Road (Left Out)	0.04	0	0	9999999	2	0
	Chanctonbury Ring Road (Right Out)	0.45	1	0	9999999	1	0
	A283 East (right turn)	0.57	2	0	0.47	1	0
	Water Lane (Left Out)	0.68	2	0	1.08	21	-4
	Water Lane (Right Out)	0.13	0	0	1.00	5	0
	A283 West (right turn)	0.00	0	0	0.00	0	0
	Total Queue	**-**	**5**	**0**	**-**	**30**	**-4**

* RFC = Ratio of flow to capacity
* Queue = Measured in vehicles

6.8 Table 6C shows that the proposed junction improvements by widening Water Lane and increasing visibility to the left reduce the increase in queue under Scenario 1 (from +11 to +4 vehicles), results in no increase in queue length under Scenario 2, and decrease the queue length in Scenario 3 by -1 vehicle and in Scenario 4 by -4 vehicles compared to 2033 Baseline Scenario.

Budget Cost Estimate for Off-Site Highway Works

6.9 A summary of the budget cost estimate for the off-site highways works for the proposed junction improvements is provided in Table 6D.

Table 6D Budget Cost Estimate: A283 / Water Lane

Item	Description	£
	Preliminaries 15%	£2,178.75
1.0	Site Clearance Works	£1,515.00
2.0	Earthworks	£2,736.00
3.0	Pavement	£8,524.00
4.0	Drainage	£0.00
5.0	Signs and Markings	£1,750.00
6.0	Other	£2,000.00
	Total	**£18,704**
	Contingency 10%	**£1,870**
	Civils Total	**£20,574**

6.10 Full details for the budget cost estimate are provided as Appendix 2.5.

7.0 Junction 3 – A283 / Maudlin Lane / Clays Hill / Castle Lane / The Street Roundabout

7.1 The A283 / Maudlin Lane / Clays Hill / Castle Lane / The Street Roundabout has been assessed for capacity using TRL's Junction's 9 Software.

Existing Junction Arrangement

7.2 The ARCADY model output for 2033 Baseline Scenario with existing junction arrangement is provided as Appendix 3.1. The results are summarised in Table 7A.

Table 7A ARCADY Outputs: A283 / Clays Hill Roundabout – 2033 Baseline Scenario

Arm	AM Peak Hour		PM Peak Hour	
	RFC	Queue	RFC	Queue
A283 South	1.06	51	1.24	166

	Total Queue	**-**	**91**	**+24**	**-**	**193**	**+22**
2	A283 South	1.09	66	+15	1.26	189	+23
	Maudlin Lane	0.04	0	0	0.04	0	0
	Clays Hill	0.92	9	+1	0.55	1	0
	A283 North	0.89	7	+1	0.90	8	+1
	Castle Lane	0.35	1	0	0.16	0	0
	The Street	0.33	1	0	0.35	1	0
	Total Queue	**-**	**84**	**+17**	**-**	**199**	**+24**
3	A283 South	1.08	64	+13	1.25	179	+13
	Maudlin Lane	0.04	0	0	0.04	0	0
	Clays Hill	0.92	9	+1	0.55	1	0
	A283 North	0.89	7	+1	0.90	8	+1
	Castle Lane	0.35	1	0	0.16	0	0
	The Street	0.33	1	0	0.35	1	0
	Total Queue	**-**	**82**	**+15**	**-**	**189**	**+14**
4	A283 South	1.07	58	+7	1.25	174	+12
	Maudlin Lane	0.04	0	0	0.04	0	0
	Clays Hill	0.92	9	+1	0.55	1	0
	A283 North	0.89	7	+1	0.89	7	0
	Castle Lane	0.35	1	0	0.15	0	0
	The Street	0.33	1	0	0.34	1	0
	Total Queue	**-**	**76**	**+9**	**-**	**183**	**+12**

* RFC = Ratio of flow to capacity
* Queue = Measured in vehicles

7.4 Table 7B demonstrates that all development scenarios result in increased queuing on the A283 South arm of the roundabout. during AM and PM peak hours. There is no increase, or only minor increase in queue on all other arms of the roundabout.

Proposed Junction Improvements

7.5 It is proposed to provide the following mitigation to improve the capacity of the junction and minimise the impact of the proposed development scenarios:

A283 South:

- Increase entry width from 6.7 metres to 7.2 metres (i.e., increase effective flare length from 8.0 metres to 23.5 metres).

7.6 A plan of the proposed junction improvements are provided as Appendix 3.3. The model output for the Proposed Development Scenarios, with proposed junction improvements is provided as Appendix 3.4. The results are summarised in Table 7C.

Table 7C ARCADY Outputs: A283 / Clays Hill Roundabout – 2033 Total Scenarios, with Proposed Junction Improvements

	Clays Hill	0.97	14	+6	0.62	2	+1
	A283 North	0.89	7	+1	0.89	7	0
	Castle Lane	0.35	1	0	0.15	0	0
	The Street	0.33	1	0	0.34	1	0
	Total	**-**	**35**	**-32**	**-**	**87**	**-88**

* RFC = Ratio of flow to capacity
* Queue = Measured in vehicles

7.7 Table 7C demonstrates that the proposed junction improvements would significantly increase the capacity of the junction, by decreasing the queue lengths on the A283 South arm of the roundabout. In the AM peak hour, on the A283 South arm, the queue length decreases by -35 vehicles in Scenario 1; -36 vehicles in Scenario 2; -37 vehicles in Scenario 3; and -39 vehicles in Scenario 4.

7.8 In the PM peak hour, on the A283 South arm, the queue length decreases by -82 vehicles in Scenario 1; -79 vehicles in Scenario 2; -85 vehicles in Scenario 3; and -89 vehicles in Scenario 4.

7.9 Whilst Table 7C shows that the proposed junction arrangement would decrease queues on the A283 South arm, there would be some increase in queue length on Clays Hill (maximum increase of +8 vehicles, to 16 vehicles, in Scenario 1) and on A283 North arm (maximum increase of +1 vehicle). However, Table 7C demonstrates that the total queues across the roundabout during the peak hour would be significantly decreased. This improves the performance of the junction.

Budget Cost Estimate for Off-Site Highway Works

7.10 A summary of the budget cost estimate for the off-site highways works for the proposed junction improvements is provided in Table 7D.

Table 7D Budget Cost Estimate: A283 / Clays Hill Roundabout

Item	Description	£
	Preliminaries 15%	£5,011.95
1.0	Site Clearance Works	£6,644.00
2.0	Earthworks	£6,328.00
3.0	Pavement	£13,991.00
4.0	Drainage	£2,200.00
5.0	Signs and Markings	£4,250.00
6.0	Other	£5,500.00
	Total	**£43,925**
	Contingency 10%	**£4,392**
	Civils Total	**£48,317**

7.11 Full details for the budget cost estimate are provided as Appendix 3.5.

8.0 Junction 4 – A283 / A2037 Roundabout

8.1 The A283 / A2037 junction has been assessed for capacity using TRL's Junction's 9 Software.

Existing Junction Arrangement

8.2 ARCADY model output for 2033 Baseline Scenario with existing junction arrangement is provided as Appendix 4.1. The results are summarised in Table 8A.

Table 8A ARCADY Outputs: A283 / A2037 Roundabout – 2033 Baseline Scenario

Arm	AM Peak Hour		PM Peak Hour	
	RFC	Queue	RFC	Queue
A2037	0.81	4	0.79	4
A283 South	0.83	5	0.91	9
A283 North	0.94	12	0.81	4
Total Queue	**-**	**21**	**-**	**17**

8.3 The model output for the Proposed Development Scenarios, under the existing junction arrangement is provided as Appendix 4.2. The results are summarised in Table 8B.

Table 8B ARCADY Outputs: A283 / A2037 Roundabout – 2033 Total Scenarios, with Existing Junction Arrangement

Scenario	Arm	AM Peak Hour			PM Peak Hour		
		RFC	Queue	Increase in Queue (From 2033 Base)	RFC	Queue	Increase in Queue (From 2033 Base)
1	A2037	0.83	5	+1	0.85	5	+1
	A283 South	0.87	6	+1	0.93	11	+2
	A283 North	0.96	16	+4	0.85	5	+1
	Total Queue	**-**	**27**	**+6**	**-**	**21**	**+4**
2	A2037	0.83	5	+1	0.81	4	0
	A283 South	0.86	6	+1	0.94	12	+3
	A283 North	0.96	15	+3	0.83	5	+1
	Total Queue	**-**	**26**	**+5**	**-**	**21**	**+4**
3	A2037	0.82	4	0	0.81	4	0
	A283 South	0.86	6	+1	0.93	11	+2
	A283 North	0.95	14	+2	0.83	5	+1
	Total Queue	**-**	**26**	**+5**	**-**	**20**	**+3**
4	A2037	0.83	5	+1	0.80	4	0
	A283 South	0.85	5	0	0.92	10	+1
	A283 North	0.96	15	+3	0.82	4	0
	Total Queue	**-**	**25**	**+4**	**-**	**18**	**+1**

* RFC = Ratio of flow to capacity
* Queue = Measured in vehicles

8.4 Table 8B demonstrates that all development scenarios do not result in significant increase in queueing on all arms of the junction during AM and PM peak hours. As such it is not deemed necessary to propose any mitigation at this junction.

9.0 Junction 5 and 6 – Site Access North and South

9.1 At the time of producing this Technical Note, the site access arrangement remains to be resolved.

9.2 As such, junction capacity assessment of the proposed access arrangements for the eastern and western portions of the site would be undertaken in due course.

10.0 Junction 7 – A283 / A27 Slips Roundabout

10.1 The A283 / A27 Slips junction has been assessed for capacity using TRL's Junction's 9 Software.

Existing Junction Arrangement

10.2 The ARCADY model output for 2033 Baseline Scenario with existing junction arrangement is provided as Appendix 5.1. The results are summarised in Table 10A.

Table 10A ARCADY Outputs: A283 / A27 Slips Roundabout – 2033 Baseline Scenario

Arm	AM Peak Hour		PM Peak Hour	
	RFC	Queue	RFC	Queue
A27 Westbound Slips	0.59	1	0.97	19
A283 South	1.09	58	1.11	58
A283 North	0.92	10	0.81	4
A27 Eastbound Slips	0.34	1	0.31	0
Total Queue	**-**	**70**	**-**	**81**

10.3 The model output for the Proposed Development Scenarios, under the existing junction arrangement is provided as Appendix 5.2. The results are summarised in Table 10B.

Table 10B ARCADY Outputs: A283 / A27 Slips Roundabout – 2033 Total Scenarios, with Existing Junction Arrangement

Scenario	Arm	AM Peak Hour			PM Peak Hour		
		RFC	Queue	Increase in Queue (From 2033 Base)	RFC	Queue	Increase in Queue (From 2033 Base)
1	A27 Westbound Slips	0.65	2	+1	1.04	55	+36
	A283 South	1.22	114	+56	1.19	93	+35
	A283 North	1.02	37	+27	0.94	13	+9
	A27 Eastbound Slips	0.39	1	0	0.36	1	+1
	Total Queue	**-**	**154**	**+84**	**-**	**162**	**+81**
2	A27 Westbound Slips	0.64	2	+1	1.02	40	+21
	A283 South	1.21	110	+52	1.16	80	+22
	A283 North	0.99	25	+15	0.96	16	+12
	A27 Eastbound Slips	0.39	1	0	0.35	1	+1
	Total Queue	**-**	**138**	**+68**	**-**	**137**	**+56**
3	A27 Westbound Slips	0.62	2	+1	1.01	33	+14
	A283 South	1.14	78	+20	1.16	77	+19
	A283 North	0.97	18	+8	0.88	7	+3
	A27 Eastbound Slips	0.36	1	0	0.34	1	+1
	Total Queue	**-**	**99**	**+29**	**-**	**118**	**+37**
4	A27 Westbound Slips	0.64	2	+1	1.00	28	+9
	A283 South	1.21	109	+51	1.14	71	+13
	A283 North	0.94	13	+3	0.90	8	+4
	A27 Eastbound Slips	0.38	1	0	0.33	1	+1
	Total Queue	**-**	**125**	**+55**	**-**	**108**	**+27**

* RFC = Ratio of flow to capacity
* Queue = Measured in vehicles

10.4 Table 10B demonstrates that under all development scenarios, there would be increased queuing on A283 South arm of the roundabout during AM peak, and on A283 North arm under Scenario 1 and 2.

10.5 Table 10B also demonstrates that under all development scenarios, there would be increased queuing on A27 westbound slips and A283 South arms of the roundabout during PM peak, and on A283 North arm under Scenario 1 and 2.

Proposed Junction Improvements

10.6 It is proposed to provide the following mitigation to improve the capacity of the junction and minimise the impact of the proposed development scenarios:

A27 Westbound Slips:

- Increase entry width from 7.4 metres to 11.3 metres (i.e., increase flare length from 12.2 metres to 32.5 metres);
- Dedicated left hand lane for A283 South traffic; and
- Lane direction road markings.

A283 South:

- Increase entry width from 9.7 metres to 12.0 metres (i.e., increase flare length from 4.1 metres to 26.4 metres);
- Dedicated left hand lane for A283 North traffic; and
- Lane direction road markings.

A283 North:

- Increase entry width from 7.0 metres to 11.2 metres (i.e., increase flare length from 11.5 metres to 26.3 metres);
- Dedicated left hand lane for A27 Eastbound traffic; and
- Lane direction road markings.

A27 Eastbound Slips:

- Increase entry width from 6.6 metres to 11.1 metres (i.e., increase flare length from 11.5 metres to 37.4 metres);
- Dedicated left hand lane for A27 Westbound traffic and
- Lane direction road markings.

Circulatory Lanes:

- Increase from two lanes to three lanes;

- Lane direction road markings.

10.7 A plan of the proposed junction improvements are provided as Appendix 5.3. The model output for the Proposed Development Scenarios, with proposed junction improvements is provided as Appendix 5.4. The results are summarised in Table 10C.

Table 10C ARCADY Outputs: A283 / A27 Slips Roundabout – 2033 Total Scenarios, with Proposed Junction Improvements

Scenario	Arm	AM Peak Hour			PM Peak Hour		
		RFC	Queue	Increase in Queue (From 2033 Base)	RFC	Queue	Increase in Queue (From 2033 Base)
1	A27 Westbound Slips	0.46	0	-1	0.74	3	-16
	A283 South	0.64	2	-56	0.62	2	-56
	A283 North	0.67	2	-8	0.62	2	-2
	A27 Eastbound Slips	0.27	0	-1	0.25	0	0
	Total Queue	**-**	**4**	**-66**	**-**	**7**	**-74**
2	A27 Westbound Slips	0.46	0	-1	0.73	3	-16
	A283 South	0.64	2	-56	0.60	2	-56
	A283 North	0.66	2	-8	0.63	2	-2
	A27 Eastbound Slips	0.27	0	-1	0.24	0	0
	Total Queue	**-**	**4**	**-66**	**-**	**7**	**-74**
3	A27 Westbound Slips	0.44	1	-1	0.72	3	-16
	A283 South	0.61	2	-56	0.60	2	-56
	A283 North	0.64	2	-8	0.58	1	-3
	A27 Eastbound Slips	0.25	0	-1	0.23	0	0
	Total Queue	**-**	**5**	**-65**	**-**	**6**	**-75**
4	A27 Westbound Slips	0.45	1	-1	0.71	3	-16
	A283 South	0.64	2	-56	0.59	1	-57
	A283 North	0.62	2	-8	0.59	2	-2
	A27 Eastbound Slips	0.26	0	-1	0.23	0	0
	Total Queue	**-**	**5**	**-65**	**-**	**6**	**-75**

* RFC = Ratio of flow to capacity
* Queue = Measured in vehicles

10.8 Table 10C demonstrates that the proposed junction improvements would result in all arms of the roundabout operating with theoretical capacity (i.e., RFC of less than 0.85) in all proposed development scenarios in AM and PM peak hours.

10.9 Table 10C also demonstrates that there would be significantly decrease in queuing, with maximum queue length of two vehicles in AM peak (on A283 South and A293 North arms), and maximum queue length of three vehicles in PM peak (on A27 Westbound slips arm).

Budget Cost Estimate for Off-Site Highway Works

10.10 A summary of the budget cost estimate for the off-site highways works for the proposed junction improvements is provided in Table 10D.

Table 10D Budget Cost Estimate: A283 / A27 Slips Roundabout

Item	Description	£
	Preliminaries 15%	£54,804.30
1.0	Site Clearance Works	£31,655.00
2.0	Earthworks	£112,263.00
3.0	Pavement	£207,944.00
4.0	Drainage	£0.00
5.0	Signs and Markings	£13,500.00
6.0	Other	£57.362.50
	Total	**£477,529**
	Contingency 10%	**£47,753**
	Civils Total	**£525,282**

10.11 Full details for the budget cost estimate are provided as Appendix 5.5.

11.0 Junction 8 – A283 / Upper Shoreham Road Roundabout

11.1 The A283 / Upper Shoreham Road junction has been assessed for capacity using TRL's Junction's 9 Software.

Existing Junction Arrangement

11.2 The ARCADY model output for 2033 Baseline Scenario with existing junction arrangement is provided as Appendix 6.1. The results are summarised in Table 11A.

Table 11A ARCADY Outputs: A283 / Upper Shoreham Road Roundabout – 2033 Baseline Scenario

Arm	AM Peak Hour		PM Peak Hour	
	RFC	Queue	RFC	Queue
Upper Shoreham Road	0.88	6	0.92	9
A283 South	1.04	24	1.04	25
A283 North	1.10	50	1.43	238
Total Queue	**-**	**80**	**-**	**272**

11.3 The model output for the Proposed Development Scenarios, under the existing junction arrangement is provided as Appendix 6.2. The results are summarised in Table 11B.

Table 11B ARCADY Outputs: A283 / Upper Shoreham Road Roundabout – 2033 Total Scenarios, with Existing Junction Arrangement

Scenario	Arm	AM Peak Hour			PM Peak Hour		
		RFC	Queue	Increase in Queue (From 2033 Base)	RFC	Queue	Increase in Queue (From 2033 Base)
1	Upper Shoreham Road	0.90	8	+2	0.94	11	+2
	A283 South	1.13	46	+22	1.10	39	+14
	A283 North	1.13	62	+12	1.52	307	+69
	Total Queue	**-**	**116**	**+36**	**-**	**357**	**+85**
2	Upper Shoreham Road	0.90	8	+2	0.94	11	+2
	A283 South	1.13	45	+21	1.08	35	+10
	A283 North	1.12	60	+10	1.53	313	+75
	Total Queue	**-**	**113**	**+33**	**-**	**359**	**+87**
3	Upper Shoreham Road	0.89	7	+1	0.93	10	+1
	A283 South	1.07	31	+7	1.07	32	+7
	A283 North	1.12	56	+6	1.47	271	+33
	Total Queue	**-**	**94**	**+14**	**-**	**313**	**+41**
4	Upper Shoreham Road	0.89	7	+1	0.93	10	+1
	A283 South	1.13	45	+21	1.07	30	+5
	A283 North	1.11	53	+3	1.48	278	+40
	Total Queue	**-**	**105**	**+25**	**-**	**318**	**+46**

* RFC = Ratio of flow to capacity
* Queue = Measured in vehicles

11.4 Table 11B demonstrates that all proposed development scenarios result in increased queues on all arms of the roundabout during AM and PM peak hours.

Proposed Junction Improvements

11.5 It is proposed to provide the following mitigation to improve the capacity of the junction and minimise the impact of the proposed development scenarios:

A283 South:

- Increase entry width from 4.5 metres to 6.2 metres (effective flare length increase from 2.8 metres to 22.1 metres) by realigning the western kerbline within adopted highway,

A283 North:

- Increase entry width from 4.5 metres to 5.5 metres (effective flare length increase from 0.8 metres to 2.8 metres) by realigning the northeastern kerbline, and amending the splitter island.

Distance Between Arms:

- Increase distance between arms (i.e., increase size of roundabout):
  - Between A283 South and A283 North, from 17.7 metres to 18.3 metres;
  - Between A283 North and Upper Shoreham Road, from 15.4 metres to 16.7 metres;
  - Between Upper Shoreham Road and A283 South, from 15.9 metres to 16.8 metres.

11.6 A plan of the proposed junction improvements are provided as Appendix 6.3. The model output for the Proposed Development Scenarios, with proposed junction improvements is provided as Appendix 6.4. The results are summarised in Table 11C.

Table 11C ARCADY Outputs: A283 / Upper Shoreham Road Roundabout – 2033 Total Scenarios, with Proposed Junction Improvements

Scenario	Arm	AM Peak Hour			PM Peak Hour		
		RFC	Queue	Increase in Queue (From 2033 Base)	RFC	Queue	Increase in Queue (From 2033 Base)
1	Upper Shoreham Road	0.92	9	+3	0.97	15	+6
	A283 South	0.82	4	-20	0.80	4	-21
	A283 North	1.08	44	-6	1.44	251	+13
	Total Queue	**-**	**57**	**-23**	**-**	**270**	**-2**
2	Upper Shoreham Road	0.92	9	+3	0.96	14	+5
	A283 South	0.82	4	-20	0.79	4	-21
	A283 North	1.07	41	-9	1.45	256	+18
	Total Queue	**-**	**54**	**-26**	**-**	**274**	**+2**
3	Upper Shoreham Road	0.91	8	+2	0.95	13	+4
	A283 South	0.78	3	-21	0.78	3	-22
	A283 North	1.06	36	-14	1.40	217	-21
	Total Queue	**-**	**47**	**-33**	**-**	**233**	**-39**
4	Upper Shoreham Road	0.92	9	+3	0.95	12	+3
	A283 South	0.82	4	-20	0.78	3	-22
	A283 North	1.05	35	-15	1.40	223	-15
	Total Queue	**-**	**48**	**-32**	**-**	**238**	**-34**

* RFC = Ratio of flow to capacity
* Queue = Measured in vehicles

11.7 Table 11C demonstrates that the proposed junction improvements would result in decreased queuing on A283 South and A283 North arms of the roundabout under all development scenarios in AM peak hour. There would continue to be minor increase in queuing on Upper Shoreham Road.

11.8 Table 11C demonstrates that the proposed junction improvements would result in decreased queuing on A283 South arm in all development scenarios in PM peak hour. There would also be decrease queuing on A283 North arm in Scenario 3 and 4.

Budget Cost Estimate for Off-Site Highway Works

11.9 A summary of the budget cost estimate for the off-site highways works for the proposed junction improvements is provided in Table 11D.

Table 11D Budget Cost Estimate: A283 / Upper Shoreham Road Roundabout

Item	Description	£
	Preliminaries 15%	£8,405.18
1.0	Site Clearance Works	£7,922.00
2.0	Earthworks	£10,427.00
3.0	Pavement	£27,335.00
4.0	Drainage	£4,400.00
5.0	Signs and Markings	£5,950.00
6.0	Other	£9,600.00
	Total	**£74,040**
	Contingency 10%	**£7,404**
	Civils Total	**£81,144**

11.10 Full details for the budget cost estimate are provided as Appendix 6.5.

12.0 Junction 9 – A283 / A259 Roundabout

12.1 The A283 / A259 junction has been assessed for capacity using TRL's Junction's 9 Software.

Existing Junction Arrangement

12.2 The ARCADY model output for 2033 Baseline Scenario with existing junction arrangement is provided as Appendix 7.1. The results are summarised in Table 12A.

Table 12A ARCADY Outputs: A283 / A259 Roundabout – 2033 Baseline Scenario

Arm	AM Peak Hour		PM Peak Hour	
	RFC	Queue	RFC	Queue
A259 East	1.03	29	1.65	326
A259 West	1.60	498	1.09	63
A283	0.56	1	0.93	10
Total Queue	**-**	**528**	**-**	**399**

12.3 The model output for the Proposed Development Scenarios, under the existing junction arrangement is provided as Appendix 7.2. The results are summarised in Table 12B.

Table 12B ARCADY Outputs: A283 / A259 – 2033 Total Scenarios, with Existing Junction Arrangement

Scenario	Arm	AM Peak Hour			PM Peak Hour		
		RFC	Queue	Increase in Queue (From 2033 Base)	RFC	Queue	Increase in Queue (From 2033 Base)
1	A259 East	1.06	38	+9	1.71	365	+39
	A259 West	1.64	542	+44	1.10	69	+6
	A283	0.57	1	0	0.99	19	+9
	Total Queue	**-**	**581**	**+53**	**-**	**453**	**+54**
2	A259 East	1.06	38	+9	1.69	357	+31
	A259 West	1.64	541	+43	1.10	67	+4
	A283	0.57	1	0	1.00	20	+10
	Total Queue	**-**	**580**	**+52**	**-**	**444**	**+45**
3	A259 East	1.04	32	+3	1.68	344	+18
	A259 West	1.61	510	+12	1.10	66	+3
	A283	0.56	1	0	0.96	13	+3
	Total Queue	**-**	**543**	**+15**	**-**	**423**	**+24**
4	A259 East	1.05	37	+12	1.68	342	+16
	A259 West	1.64	541	+43	1.10	66	+3
	A283	0.56	1	0	0.96	13	+3
	Total Queue	**-**	**579**	**+51**	**-**	**421**	**+22**

* RFC = Ratio of flow to capacity
* Queue = Measured in vehicles

12.4 Table 12B demonstrates that under all development scenarios, there is increased queueing on A29 East and A259 West arms of the roundabout in the AM peak hour, and on all arms of the junction in PM peak hour.

Proposed Junction Improvements

12.5 It is proposed to provide the following mitigation to improve the capacity of the junction and minimise the impact of the proposed development scenarios:

Roundabout Size:

- Increase size of roundabout from ICD of 26 metres to ICD of 28.5 metres; and
- Give way lines for A259 West and A283 arms of roundabout moved back, making sure visibilities work.

A259 West:

- Decrease entry width from 7.0 metres to 6.6 metres, effective flare length increased from 1.9 metres to 26 metres.

12.6 A plan of the proposed junction improvements are provided as Appendix 7.3. The model output for the Proposed Development Scenarios, with proposed junction improvements is provided as Appendix 7.4. The results are summarised in Table 12C.

Table 12C ARCADY Outputs: A283 / A259 Roundabout – 2033 Total Scenarios, with Proposed Junction Improvements

Scenario	Arm	AM Peak Hour			PM Peak Hour		
		RFC	Queue	Increase in Queue (From 2033 Base)	RFC	Queue	Increase in Queue (From 2033 Base)
1	A259 East	0.77	3	-26	1.15	88	-238
	A259 West	1.01	33	-465	0.70	2	-61
	A283	0.48	1	0	0.69	2	-8
	Total Queue	**-**	**37**	**-491**	**-**	**92**	**-307**
2	A259 East	0.77	3	-26	1.15	85	-241
	A259 West	1.01	33	-465	0.70	2	-61
	A283	0.48	1	0	0.69	2	-8
	Total Queue	**-**	**37**	**-491**	**-**	**89**	**-310**
3	A259 East	0.75	3	-26	1.13	78	-248
	A259 West	0.99	26	-472	0.70	2	-91
	A283	0.47	1	0	0.66	2	-8
	Total Queue	**-**	**30**	**-498**	**-**	**82**	**-317**
4	A259 East	0.77	3	-26	1.13	77	-249
	A259 West	1.01	33	-465	0.70	2	-61
	A283	0.47	1	0	0.66	2	-8
	Total Queue	**-**	**37**	**-498**	**-**	**81**	**-391**

* RFC = Ratio of flow to capacity
* Queue = Measured in vehicles

12.7 Table 12C demonstrates that the proposed junction improvements result in a significant decrease in queuing on A259 East and A259 West arms of the roundabout (with no increase in queuing on A283 North) in the AM peak hour.

12.8 Table 12C also demonstrates that the proposed junction improvements result in a significant decrease in queuing on all arms of the roundabout in the PM peak hour.

Budget Cost Estimate for Off-Site Highway Works

12.9 A summary of the budget cost estimate for the off-site highways works for the proposed junction improvements is provided in Table 12D.

Table 12D Budget Cost Estimate: A283 / A259 Roundabout

Item	Description	£
	Preliminaries 15%	£6,350.10
1.0	Site Clearance Works	£6,875.00
2.0	Earthworks	£7,415.00
3.0	Pavement	£17,344.00
4.0	Drainage	£0.00
5.0	Signs and Markings	£10,700.00
6.0	Other	£4,000.00
	Total	**£52,684**
	Contingency 10%	**£5,268**
	Civils Total	**£57,953**

12.10 Full details for the budget cost estimate are provided as Appendix 7.5.

13.0 Junction 10 – A27 / New Monks Farm Signal Roundabout

13.1 The committed New Monks Farm signal junction (between A27 / Old Shoreham Road) has been assessed for capacity using JCT's LinSig V3 Software.

Committed Junction Arrangement

13.2 The plan of the committed junction arrangement (i.e., Vectos drawing number VN201557/PL-03) is provided as Appendix 8.1.

13.3 The LinSig model output for 2033 Baseline Scenario and Proposed Development Scenarios is provided as Appendix 8.2. The results for the 2033 Baseline Scenario are summarised in Table 13A.

Table 13A LinSig Outputs: A27 / New Monks Farm – 2033 Baseline Scenario

Arm/Lane		AM Peak Hour		PM Peak Hour	
		DoS	Mean Max Queue	DoS	Mean Max Queue
1/1	A27 East Left Ahead	72.2%	15	69.8%	14
1/2	A27 East Ahead	60.2%	10	61.7%	10

	Total Queue		**-**	**115**	**+3**	**-**	**169**	**+7**

* DoS = Degree of Saturation
* Queue = Measured in PCUs

13.5 Table 13B shows that, with the exception of the Old Shoreham Road (Left Ahead) arm in the PM peak hour, all arms/lanes in both AM and PM peak hours in all proposed development scenarios operate within theoretical capacity (i.e., DoS less than 100%) on of the committed junction arrangement.

13.6 It should be noted that on the Old Shoreham Road (Left Ahead) arm in the PM peak hour, all proposed development scenarios do not increase the DoS or queue length and therefore they result in nil detriment compared to the baseline scenario.

13.7 In light of the above, it is considered that there is no requirement to propose improvements to the committed junction arrangement.

14.0 Junction 11 – A27 / A2025 (Lancing Manor) Roundabout

14.1 The Lancing Manor Roundabout, i.e., A27 / A2025 Grinstead Lane / Manor Road junction has been assessed for capacity using TRL's Junction's 9 Software.

Committed Junction Arrangement

14.2 An agreement between Highways England (now National Highways) and Adur District Council and the New Monks Farm applicant requirement that the Monks Farm applicant either enters into a S278 Agreement to undertake traffic improvements to the Lancing Manor Roundabout in accordance with Vectos' drawing number VN40408/PL-010 or pays a

contributions in full for the cost of the works. The junction improvements as per Vectos' drawing number VN40408/PL-010 is therefore regarded as 'committed highway improvements' and are therefore used to assess the baseline as well as development scenario traffic impact associated with Shoreham Cement Works study.

14.3 As such, the Lancing Manor Roundabout has been modelled as per ARCADY outputs provided by Vectos in the Transport Assessment for the New Monks Farm development. A plan of the committed junction arrangement is provided as Appendix 9.1.

14.4 The ARCADY model output for 2033 Baseline Scenario is provided as Appendix 9.2. The results are summarised in Table 14A.

Table 14A ARCADY Outputs: Lancing Manor Roundabout – 2033 Baseline Scenario with Committed Junction Arrangement

Arm	AM Peak Hour		PM Peak Hour	
	RFC	Queue	RFC	Queue
A27 East	1.25	338	1.30	446
A2025	1.72	541	0.89	7
A27 West	1.29	362	1.45	512
Manor Road	1.06	23	0.53	1
Total Queue	**-**	**1,264**	**-**	**966**

14.5 The model output for the Proposed Development Scenarios, under the committed junction arrangement is provided as Appendix 9.3. The results are summarised in Table 14B.

Table 14B ARCADY Outputs: Lancing Manor Roundabout – 2033 Total Scenarios, with Committed Junction Arrangement

Scenario	Arm	AM Peak Hour			PM Peak Hour		
		RFC	Queue	Increase in Queue (From 2033 Base)	RFC	Queue	Increase in Queue (From 2033 Base)
1	A27 East	1.17	403	+65	1.22	538	+92
	A2025	1.58	513	-28	0.83	5	-2
	A27 West	1.20	405	+43	1.31	546	+34
	Manor Road	0.97	14	-9	0.49	1	0
	Total Queue	**-**	**1,335**	**+71**	**-**	**1,090**	**+124**
2	A27 East	1.16	388	+50	1.23	545	+99
	A2025	1.58	511	-30	0.82	4	-3
	A27 West	1.20	403	+41	1.30	528	+16
	Manor Road	0.97	14	-9	0.48	1	0
	Total Queue	**-**	**1,316**	**+52**	**-**	**1,078**	**+112**
3	A27 East	1.15	364	+26	1.20	486	+40
	A2025	1.57	504	-37	0.82	4	-3
	A27 West	1.19	372	+10	1.30	524	+12
	Manor Road	0.96	13	-10	0.48	1	0
	Total Queue	**-**	**1,253**	**-11**	**-**	**1,015**	**+49**

4	A27 East	1.15	355	+17	1.21	501	+55
	A2025	1.58	514	-27	0.81	4	-3
	A27 West	1.20	401	+39	1.29	514	+2
	Manor Road	0.97	14	-9	0.48	1	0
	Total Queue	**-**	**1,284**	**+20**	**-**	**1,020**	**+54**

* RFC = Ratio of flow to capacity
* Queue = Measured in vehicles

14.6 Table 14B shows that all proposed development scenarios result in an increase in queueing on the A27 East arm and A27 West arm of the roundabout during the AM and PM peak hours. Despite a decrease in queues on A2025 Grinstead Lane and Manor Road in the AM peak hour, and on Grinstead Lane in PM peak hour, the total queues increase in all development scenarios.

Proposed Junction Improvements

14.7 It is proposed to provide the following mitigation to improve the capacity of the junction further and minimise the impact of the proposed development scenarios:

Roundabout Size:

- Increase size of roundabout to ICD of 60 metres; and
- Circulatory lanes broadly as per committed arrangement, with additional road markings and directional arrows

A27 East

- Increase entry width from 9.8 metres to 11.3 metres

A2025 Grinstead Lane:

- Increase entry width from 11.5 metres to 12.8 metres (effective flare length increased from 10.0 metres to 15.0 metres)

A27 West:

- Increase entry width from 11.5 metres to 13.1 metres

Manor Road:

- Increase approach road half width from 4.1 metres to 5.4 metres
- Increase entry width from 7.4 metres to 8.0 metres

14.8 **It should be noted that these improvements require land take from Lancing Manor Estate.**

14.9 A plan of the proposed junction improvements are provided as Appendix 9.4. The model output for the Proposed Development Scenarios, with proposed junction improvements is provided as Appendix 9.5. The results are summarised in Table 14C.

Table 14C ARCADY Outputs: Lancing Manor Roundabout – 2033 Total Scenarios, with Proposed Junction Improvements

Scenario	Arm	AM Peak Hour			PM Peak Hour		
		RFC	Queue	Increase in Queue (From 2033 Base)	RFC	Queue	Increase in Queue (From 2033 Base)
1	A27 East	1.10	155	-183	1.05	150	-296
	A2025	1.71	466	-75	0.82	4	-3
	A27 West	1.27	340	-22	1.26	466	-46
	Manor Road	0.89	7	-16	0.41	1	0
	Total Queue	**-**	**968**	**-296**	**-**	**621**	**-345**
2	A27 East	1.10	147	-191	1.16	234	-212
	A2025	1.71	462	-79	0.89	7	0
	A27 West	1.27	338	-24	1.41	455	-57
	Manor Road	0.89	7	-16	0.45	1	0
	Total Queue	**-**	**954**	**-310**	**-**	**697**	**-269**
3	A27 East	1.09	134	-204	1.13	200	-246
	A2025	1.71	452	-89	0.90	7	0
	A27 West	1.25	308	-54	1.40	451	-61
	Manor Road	0.89	6	-17	0.45	1	0
	Total Queue	**-**	**900**	**-364**	**-**	**659**	**-307**
4	A27 East	1.08	129	-209	1.14	208	-238
	A2025	1.72	461	-80	0.89	7	0
	A27 West	1.27	337	-25	1.40	441	-71
	Manor Road	0.89	7	-16	0.45	1	0
	Total Queue	**-**	**934**	**-330**	**-**	**657**	**-309**

* RFC = Ratio of flow to capacity
* Queue = Measured in vehicles

14.10 Table 14C demonstrates that the proposed junction improvements would produce significant decrease in queueing compared to the 2033 Baseline Scenario with the committed junction arrangement.

Budget Cost Estimate for Off-Site Highway Works

14.11 A summary of the budget cost estimate for the off-site highways works associated with the committed junction arrangements and ADL's proposed junction arrangements is provided in Table 11D.

14.12 The costs associated with the ADL's proposed junction arrangements have been calculated on the assumption that committed junction as per Vectos' drawing number VN40408/PL-010 is not built by 2033.

Table 14D Budget Cost Estimate: Lancing Manor Roundabout

		Committed Junction Arrangement	ADL Proposed Arrangement	Difference
Item	**Description**	**£**	**£**	**£**
	Preliminaries 15%	£25,993.86	£66,238.47	£40,244.61
1.0	Site Clearance Works	£27,933.00	£55,084.00	£27,151.00
2.0	Earthworks	£37,995.40	£158,493.80	£120,498.40
3.0	Pavement	£91,764.00	£183,812.00	£92,048.00
4.0	Drainage	£5,500.00	£18,200.00	£12,700.00
5.0	Signs and Markings	£10,100.00	£26,000.00	£15,900.00
6.0	Other	£33,250.00	£55,475.00	£22,225.00
	Total	**£232,536.00**	**£563,303.00**	**£330,767.00**
	Contingency 10%	**£23,254**	**£56,330.00**	**£33,076.00**
	Civils Total	**£255,790.00**	**£619,634.00**	**£363,844.00**

14.13 Table 14D shows that the committed junction arrangement could cost approximately £256,000 to construct, whilst the proposed junction arrangement put forward by ADL to mitigate the impact of Shoreham Cement Works development could cost approximately £620,000 to construct. This excludes costs related to purchase of land from Lancing Manor.

14.14 Therefore, the proposed junction arrangement to mitigate Shoreham Cement Works development could require an additional £364,000 to build when compared to the committed junction arrangement. As discussed above, this does not take into account cost related to purchase of land from Lancing Manor Estate.

14.15 Full details for the budget cost estimate for the committed junction improvements, and ADL's proposed junction improvements are provided as Appendix 9.6 and Appendix 9.7, respectively.

15.0 SUMMARY AND CONCLUSIONS

15.1 ADL have produced this Technical Note 3 (TN3) to summarise the junction capacity assessment of the four development scenarios at the each of the junctions subject to this transport study.

15.2 ADL have assessed each of the offsite junctions with their existing (or committed) junction arrangement in the 2033 Baseline Scenario, and with the four proposed development scenarios. The following junctions are predicted to be severely impacted by the proposed development:

- Junction 1: A283/A24 (Washington) Roundabout;

- Junction 2: A283/Water Lane/Chanctonbury Ring Road crossroads;
- Junction 3: A283/Maudlin Lane/Clays Hill/Castle Lane/The Street Roundabout;
- Junction 7: A283/A27 Slips Roundabout;
- Junction 8: A283/Upper Shoreham Road Roundabout;
- Junction 9: A283/A259 Roundabout; and
- Junction 11: A27/A2025/Manor Road (Lancing Manor) Roundabout.

15.3 ADL have proposed mitigation at each of these junctions to improve capacity of the junction and reduce the impact of the proposed development scenarios, compared to the 2033 Baseline Scenario with existing (or committed) junction arrangement.

15.4 ADL have also provided budget cost estimates for the proposed off-site highways works and these are summarised in Table 15A.

Table 15A Budget Cost Estimate Summary – Off Site Highway Works

Junction	Junction Name	Total Cost (inc. Contingency 10%)
1	A283/A24 (Washington) Roundabout	£325,941 (see para 15.6 below)
2	A283/Water Lane/Chanctonbury Ring Road crossroads	£20,574 (see para 15.6 below)
3	A283/Maudlin Lane/Clays Hill/Castle Lane/The Street Roundabout	£48,317
7	A283/A27 Slips Roundabout	£525,282
8	A283/Upper Shoreham Road Roundabout	£81,144
9	A283/A259 Roundabout	£57,953
11	A27/A2025/Manor Road (Lancing Manor) Roundabout	£619,634
Total		**£1,678,845** (see para 15.6 below)

15.5 Table 15A shows that the overall costs associated with the off-site highway works is approximately £1,678,845. This excludes cost associated with purchase of land from Lancing Manor Estate in relation to Lancing Manor Roundabout improvements.

15.6 Junctions 1 and 2 may not require any mitigation should Highway Authority consider that the increase in queues as a result of the development scenarios does not warrant any improvements. Should this be the case, the overall costs associated with the off-site highway works is approximately £1,332,330.

15.7 At the time of producing TN3, the site access arrangement for Shoreham Cement Works is under review.

Summary of junction performance

	AM							PM						
	Queue (Veh)	Delay (s)	RFC	LOS	Junction Delay (s)	Junction LOS	Network Residual Capacity	Queue (Veh)	Delay (s)	RFC	LOS	Junction Delay (s)	Junction LOS	Network Residual Capacity
	2033 Base including permitted													
1 - A283 East	3.8	15.67	0.80	C	39.65	E	-8 % [3 - A283 West]	4.6	20.01	0.83	C	105.98	F	-14 % [4 - A24 North]
2 - A24 South	5.9	12.80	0.86	B				1.7	4.17	0.63	A			
3 - A283 West	45.0	126.09	1.06	F				10.5	30.37	0.93	D			
4 - A24 North	9.1	20.90	0.91	C				162.4	255.46	1.17	F			

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

4 - A24 North	9.2	21.05	0.91	C				164.3	259.30	1.17	F			

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

NOTES

1. PRELIMINARY DESIGN PROVIDED FOR ILLUSTRATIVE PURPOSES ONLY. ALL DETAILS ARE SUBJECT TO INCLUDING CHECKING STATATORY SERVICE APPARATUS.
2. DO NOT SCALE FROM THIS DRAWING.
3. BACKGROUND PLAN IS BASED UPON A DIGITAL OSBASE.
4. ALL DETAILS TO BE CONFIRMED ON SITE AND ON A TOPOGRAPHICAL SURVEY.
5. ALL TRACKS ASSUME GRADIENTS AND CAMBERS DO NOT EXCEED 1:60 AND 1:40 RESPECTIVELY OTHERWISE VEHICLE MANOEUVRABILITY MAY BE AFFECTED.
6. ALL LAND OWNERSHIP DETAILS, EXTENT OF ADOPTED HIGHWAY AND RIGHTS OF WAY TO BE CONFIRMED.
7. ASSUMES ALL LANDSCAPING CAN BE ALTERED AND NO TREES ARE SUBJECT TO TPO.

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

APPENDIX 1.4
ARCADY OUTPUT: PROPOSED DEVELOPMENT SCENARIOS (WITH PROPOSED JUNCTION IMPROVEMENTS)

File summary

File Description

Title	(untitled)
Location	
Site number	
Date	07/10/2021
Version	
Status	(new file)
Identifier

GENERAL NOTES

THIS IS A BUDGET ESTIMATE ONLY.

BUDGET ESTIMATE EXCLUDES DESIGN AND COUNCIL FEES

BUDGET ESTIMATE EXCLUDES ANY UNDERGROUND SERVICE DIVERSION COSTS

WE HAVE ASSUMED THAT THE EXISTING ROAD, WHERE RETAINED, WILL BE RESURFACED AND THE WHOLE GYRATORY HAS BEEN RESURFACED

ADL ARE NOT QUALIFIED QUANTITY SURVEYORS AND THE ABOVE ESTIMATE SHOULD NOT BE USED FOR ANY CONTRACT DOCUMENTS

2.0 Junction 2 – A283 / Water Lane / Chanctonbury Ring Road Crossroads

Junctions 9

PICADY 9 - Priority Intersection Module

Version: 9.0.2.5947

For sales and distribution information, program advice and maintenance, contact TRL:

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

D2	2033 Base including permitted	PM	ONE HOUR	16:45	18:15	15	✓

Analysis Set Details

ID	Include in report	Network flow scaling factor (%)	Network capacity scaling factor (%)
A1	✓	100.000	100.000

2033 Base including permitted, AM

Data Errors and Warnings

Severity	Area	Item	Description
Warning	Minor arm flare	B - Chanctonbury Ring Road - Minor arm geometry	Is flare very short? Estimated flare length is zero but has been increased to 1 because a zero flare length is not allowed.

Junction Network

Junctions

Junction	Name	Junction Type	Major road direction	Junction Delay (s)	Junction LOS
1	2 - A283/Water Lane/Chanctonbury Ring Road	Crossroads	Two-way	5.95	A

Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	-16	Stream B-AD

Arms

Arms

Arm	Name	Description	Arm type
A	A283 East		Major
B	Chanctonbury Ring Road		Minor
C	A283 West		Major
D	Water Lane		Minor

Major Arm Geometry

Arm	Width of carriageway (m)	Has kerbed central reserve	Has right turn bay	Width for right turn (m)	Visibility for right turn (m)	Blocks?	Blocking queue (PCU)
A - A283 East	6.80		✓	2.20	100.0	✓	2.00
C - A283 West	6.80		✓	2.20	100.0	✓	2.00

Geometries for Arm C are measured opposite Arm B. Geometries for Arm A (if relevant) are measured opposite Arm D.

Minor Arm Geometry

Arm	Minor arm type	Width at give-way (m)	Width at 5m (m)	Width at 10m (m)	Width at 15m (m)	Width at 20m (m)	Estimate flare length	Flare length (PCU)	Visibility to left (m)	Visibility to right (m)
B - Chanctonbury Ring Road	One lane plus flare	10.00	3.40	2.20	2.20	2.20	✓	1.00	51	80
D - Water Lane	One lane plus flare	10.00	8.30	5.50	4.20	4.10	✓	2.00	46	106

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

NOTES
1. PRELIMINARY DESIGN PROVIDED FOR ILLUSTRATIVE PURPOSES ONLY. ALL DETAILS ARE SUBJECT TO INCLUDING CHECKING STATATORY SERVICE APPARATUS.
2. DO NOT SCALE FROM THIS DRAWING.
3. BACKGROUND PLAN IS BASED UPON A DIGITAL OSBASE.
4. ALL DETAILS TO BE CONFIRMED ON SITE AND ON A TOPOGRAPHICAL SURVEY.
5. ALL TRACKS ASSUME GRADIENTS AND CAMBERS DO NOT EXCEED 1:60 AND 1:40 RESPECTIVELY OTHERWISE VEHICLE MANOEUVRABILITY MAY BE AFFECTED.
6. ALL LAND OWNERSHIP DETAILS, EXTENT OF ADOPTED HIGHWAY AND RIGHTS OF WAY TO BE CONFIRMED.
7. ASSUMES ALL LANDSCAPING CAN BE ALTERED AND NO TREES ARE SUBJECT TO TPO.

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

Scenario 4 Total, PM

Data Errors and Warnings

Severity	Area	Item	Description
Warning	Minor arm flare	B - Chanctonbury Ring Road - Minor arm geometry	Is flare very short? Estimated flare length is zero but has been increased to 1 because a zero flare length is not allowed.

Junction Network

Junctions

Junction	Name	Junction Type	Major road direction	Junction Delay (s)	Junction LOS
1	2 - A283/Water Lane/Chanctonbury Ring Road	Crossroads	Two-way	36.54	E

Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	-21	Stream B-AD

Traffic Demand

6 - The Street	0.5	7.99	0.33	A				0.5	7.35	0.34	A			

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

1. PRELIMINARY DESIGN PROVIDED FOR ILLUSTRATIVE PURPOSES ONLY. ALL DETAILS ARE SUBJECT TO INCLUDING CHECKING STATATORY SERVICE APPARATUS.
2. DO NOT SCALE FROM THIS DRAWING.
3. BACKGROUND PLAN IS BASED UPON A DIGITAL OSBASE.
4. ALL DETAILS TO BE CONFIRMED ON SITE AND ON A TOPOGRAPHICAL SURVEY.
5. ALL TRACKS ASSUME GRADIENTS AND CAMBERS DO NOT EXCEED 1:60 AND 1:40 RESPECTIVELY OTHERWISE VEHICLE MANOEUVRABILITY MAY BE AFFECTED.
6. ALL LAND OWNERSHIP DETAILS, EXTENT OF ADOPTED HIGHWAY AND RIGHTS OF WAY TO BE CONFIRMED.
7. ASSUMES ALL LANDSCAPING CAN BE ALTERED AND NO TREES ARE SUBJECT TO TPO.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

GENERAL NOTES

THIS IS A BUDGET ESTIMATE ONLY.

BUDGET ESTIMATE EXCLUDES DESIGN AND COUNCIL FEES

BUDGET ESTIMATE EXCLUDES ANY UNDERGROUND SERVICE DIVERSION COSTS

WE HAVE ASSUMED THAT THE APPROACH LANE WILL BE RESURFACED

ADL ARE NOT QUALIFIED QUANTITY SURVEYORS AND THE ABOVE ESTIMATE SHOULD NOT BE USED FOR ANY CONTRACT DOCUMENTS

4.0 Junction 4 – A283 / A2037 Roundabout

4.1 ARCADY Output: 2033 Baseline Scenario
4.2 ARCADY Outputs: Proposed Development Scenarios

Junctions 9

ARCADY 9 - Roundabout Module

Filename: 4 - A - A283 + A2037 - Existing Junction - 2033 Base incl permitted.j9
Path: D:\5201 Shoreham\Amol\4 - A283 + A2037
Report generation date: 11/11/2021 15:19:40

Summary of junction performance

	AM							PM						
	Queue (Veh)	Delay (s)	RFC	LOS	Junction Delay (s)	Junction LOS	Network Residual Capacity	Queue (Veh)	Delay (s)	RFC	LOS	Junction Delay (s)	Junction LOS	Network Residual Capacity
	2033 Base including permitted													
1 - A2037	3.9	18.83	0.81	C	21.09	C	1 % [3 - A283 North]	3.6	16.03	0.79	C	16.83	C	4 % [2 - A283 South]
2 - A283 South	4.8	12.10	0.83	B				9.1	20.99	0.91	C			
3 - A283 North	11.6	31.87	0.94	D				4.1	11.92	0.81	B			

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

3 - A283 North	14.5	39.02	0.96	E				4.3	12.59	0.82	B			

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

Report generation date: 11/11/2021 15:40:36

Summary of junction performance

	AM							PM						
	Queue (Veh)	Delay (s)	RFC	LOS	Junction Delay (s)	Junction LOS	Network Residual Capacity	Queue (Veh)	Delay (s)	RFC	LOS	Junction Delay (s)	Junction LOS	Network Residual Capacity
	2033 Base including permitted													
1 - A27 Westbound Slips	1.4	4.96	0.59	A	56.19	F	-13 % [2 - A283 South]	18.5	39.78	0.97	E	58.86	F	-13 % [2 - A283 South]
2 - A283 South	58.1	171.06	1.09	F				58.3	187.49	1.11	F			
3 - A283 North	9.5	24.56	0.92	C				4.2	10.89	0.81	B			
4 - A27 Eastbound Slips	0.5	3.42	0.34	A				0.4	3.22	0.31	A			

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

NOTES

1. PRELIMINARY DESIGN PROVIDED FOR ILLUSTRATIVE PURPOSES ONLY. ALL DETAILS ARE SUBJECT TO INCLUDING CHECKING STATATORY SERVICE APPARATUS.
2. DO NOT SCALE FROM THIS DRAWING.
3. BACKGROUND PLAN IS BASED UPON A DIGITAL OSBASE.
4. ALL DETAILS TO BE CONFIRMED ON SITE AND ON A TOPOGRAPHICAL SURVEY.
5. ALL TRACKS ASSUME GRADIENTS AND CAMBERS DO NOT EXCEED 1:60 AND 1:40 RESPECTIVELY OTHERWISE VEHICLE MANOEUVRABILITY MAY BE AFFECTED.
6. ALL LAND OWNERSHIP DETAILS, EXTENT OF ADOPTED HIGHWAY AND RIGHTS OF WAY TO BE CONFIRMED.
7. ASSUMES ALL LANDSCAPING CAN BE ALTERED AND NO TREES ARE SUBJECT TO TPO.

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

GENERAL NOTES

THIS IS A BUDGET ESTIMATE ONLY.

BUDGET ESTIMATE EXCLUDES DESIGN AND COUNCIL FEES

BUDGET ESTIMATE EXCLUDES ANY UNDERGROUND SERVICE DIVERSION COSTS

THE ESTIMATE INCLUDES THE RESURFACING OF ALL APPROACH ROADS AND THE WHOLE GYRATORY

ADL ARE NOT QUALIFIED QUANTITY SURVEYORS AND THE ABOVE ESTIMATE SHOULD NOT BE USED FOR ANY CONTRACT DOCUMENTS

6.0 Junction 8 – A283 / Upper Shoreham Road Roundabout

Junctions 9

ARCADY 9 - Roundabout Module

Version: 9.0.2.5947

Filename: 8 - A - A283 - Upper Shm Rd - Existing Jct - 2033 Base incl permitted.j9
Path: D:\5201 Shoreham\Amol\8 - A283 Upper Shoreham Rd
Report generation date: 11/11/2021 16:17:01

Summary of junction performance

	AM							PM						
	Queue (Veh)	Delay (s)	RFC	LOS	Junction Delay (s)	Junction LOS	Network Residual Capacity	Queue (Veh)	Delay (s)	RFC	LOS	Junction Delay (s)	Junction LOS	Network Residual Capacity
	2033 Base incl permitted													
1 - Upper Shoreham Road	6.4	29.97	0.88	D	121.38	F	-18 % [3 - A283 North]	8.7	40.29	0.92	E	491.79	F	-35 % [3 - A283 North]
2 - A283 South	24.4	137.08	1.04	F				25.2	134.03	1.04	F			
3 - A283 North	49.8	196.14	1.10	F				238.1	1042.68	1.43	F			

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

NOTES

1. PRELIMINARY DESIGN PROVIDED FOR ILLUSTRATIVE PURPOSES ONLY. ALL DETAILS ARE SUBJECT TO INCLUDING CHECKING STATATORY SERVICE APPARATUS.
2. DO NOT SCALE FROM THIS DRAWING.
3. BACKGROUND PLAN IS BASED UPON A DIGITAL OSBASE.
4. ALL DETAILS TO BE CONFIRMED ON SITE AND ON A TOPOGRAPHICAL SURVEY.
5. ALL TRACKS ASSUME GRADIENTS AND CAMBERS DO NOT EXCEED 1:60 AND 1:40 RESPECTIVELY OTHERWISE VEHICLE MANOEUVRABILITY MAY BE AFFECTED.
6. ALL LAND OWNERSHIP DETAILS, EXTENT OF ADOPTED HIGHWAY AND RIGHTS OF WAY TO BE CONFIRMED.
7. ASSUMES ALL LANDSCAPING CAN BE ALTERED AND NO TREES ARE SUBJECT TO TPO.

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

GENERAL NOTES

THIS IS A BUDGET ESTIMATE ONLY.

BUDGET ESTIMATE EXCLUDES DESIGN AND COUNCIL FEES

BUDGET ESTIMATE EXCLUDES ANY UNDERGROUND SERVICE DIVERSION COSTS

THE ESTIMATE INCLUDES THE RESURFACING OF ALL APPROACH ROADS AND THE WHOLE GYRATORY

ADL ARE NOT QUALIFIED QUANTITY SURVEYORS AND THE ABOVE ESTIMATE SHOULD NOT BE USED FOR ANY CONTRACT DOCUMENTS

7.0 Junction 9 – A283 / A259 Roundabout

7.1 ARCADY Output: 2033 Baseline Scenario
7.2 ARCADY Outputs: Proposed Development Scenarios
7.3 Proposed Junction Improvements
7.4 ARCADY Outputs: Proposed Development Scenarios (With Proposed Junction Improvements)
7.5 Budget Cost Estimate for Off-Site Highway Works

Junctions 9

ARCADY 9 - Roundabout Module

Version: 9.0.2.5947

Filename: 9 - A - A283 - A259 - Existing Jct - 2033 Base incl permitted.j9
Path: D:\5201 Shoreham\Amol\9- A283 + A259

Summary of junction performance

	AM							PM						
	Queue (Veh)	Delay (s)	RFC	LOS	Junction Delay (s)	Junction LOS	Network Residual Capacity	Queue (Veh)	Delay (s)	RFC	LOS	Junction Delay (s)	Junction LOS	Network Residual Capacity
	2033 Base incl permitted													
1 - A259 East	29.4	111.12	1.03	F	907.15	F	-41 % [2 - A259 West]	325.6	1369.98	1.65	F	581.59	F	-35 % [1 - A259 East]
2 - A259 West	497.5	1682.74	1.60	F				63.0	173.47	1.09	F			
3 - A283	1.2	8.04	0.56	A				9.8	45.61	0.93	E			

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

Data Errors and Warnings

Severity	Area	Item	Description
Warning	Mini-roundabout		Mini-roundabout appears to have unbalanced flows and may behave like a priority junction; treat results with caution. See User Guide for details.[Arms 1 and 2 have 82% of the total flow for the roundabout for one or more time segments]

Junction Network

Junctions

Junction	Name	Junction Type	Arm order	Junction Delay (s)	Junction LOS

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

Data Errors and Warnings

Severity	Area	Item	Description
Warning	Mini-roundabout		Mini-roundabout appears to have unbalanced flows and may behave like a priority junction; treat results with caution. See User Guide for details.[Arms 1 and 2 have 82% of the total flow for the roundabout for one or more time segments]

Junction Network

3 - A283	0.9	5.67	0.47	A				1.9	8.25	0.66	A			

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

GENERAL NOTES

THIS IS A BUDGET ESTIMATE ONLY.

BUDGET ESTIMATE EXCLUDES DESIGN AND COUNCIL FEES

BUDGET ESTIMATE EXCLUDES ANY UNDERGROUND SERVICE DIVERSION COSTS

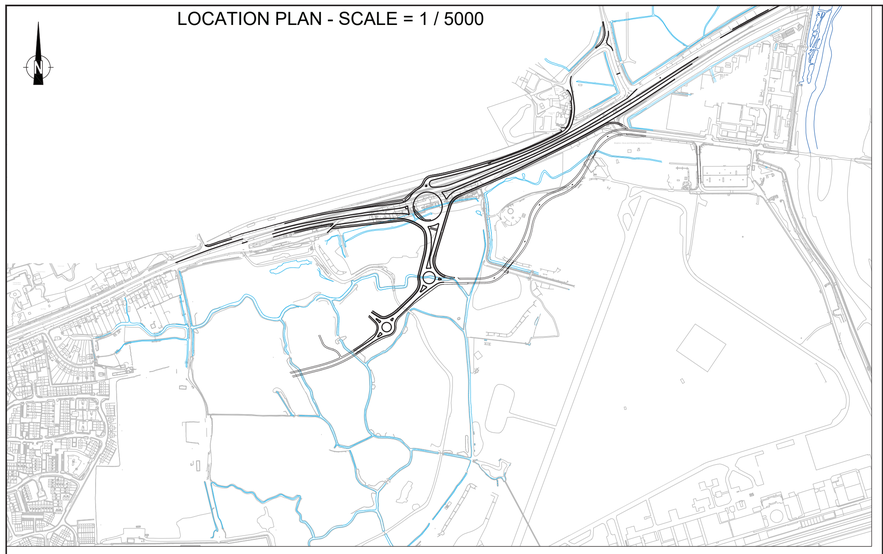
THE ESTIMATE INCLUDES THE RESURFACING OF THE WHOLE GYRATORY

ADL ARE NOT QUALIFIED QUANTITY SURVEYORS AND THE ABOVE ESTIMATE SHOULD NOT BE USED FOR ANY CONTRACT DOCUMENTS

8.0 Junction 10 – A27 / New Monks Farm Committed Signal Roundabout

8.1 Committed Junction Arrangement
8.2 LinSig Output: 2033 Baseline Scenario + Proposed Development Scenarios

LOCATION PLAN - SCALE = 1 / 5000



APPROXIMATE LOCATION FOR NORTH GATEWAY FEATURE

PROPOSED SUSSEX PAD LINK ROAD ALIGNED ADJACENT LANCING COLLEGE (FORMERLY SUSSEX PAD HOTEL)

COOMBES ROAD JUNCTION MODIFIED

BOUNDARY HEDGE TO BE REMOVED FOR NEW LANCING COLLEGE LINK ROAD

ACCESS TO CAR PARK RECONFIGURED TO NEW LINK ROAD TO PROVIDE JUNCTION VISIBILITY

BUILD-OUT REFUGE FOR SOUTHBOUND PRIORITY

CYCLISTS TO JOIN CARRIAGEWAY EAST OF PRIORITY BUILD-OUT, FOOTWAY REDUCED TO 2m WIDTH

APPROXIMATE LOCATION FOR SOUTH GATEWAY FEATURE

PROPOSED NORTH ARM OFF A27 ROUNDABOUT

3m SHARED FOOT/CYCLEWAY PLUS 500mm BUFFER STRIP ADJACENT CARRIAGEWAY

A27 SHOREHAM BYPASS

BUILD-OUT REFUGE FOR WESTBOUND PRIORITY

PROPOSED FOOTPATH/BRIDLEWAY ALONGSIDE A27 NORTHERN BOUNDARY TO BE DELIVERED AS PER PLANNING REFERENCE SDNP/18/00434/FUL

SUSSEX PAD MINOR ROAD JUNCTIONS CLOSED TO MOTOR VEHICLES

PROPOSED LAYOUT TO TIE-IN WITH CEP'S DESIGN

CEP'S PROPOSED ACCESS TO SHOREHAM AIRPORT DEVELOPMENT

ACCESS TO NEW MONKS FARM DEVELOPMENT

CUSTOMER AND SERVICE ACCESS TO IKEA STORE

PROPOSED LAYOUT TO TIE-IN WITH CEP'S DESIGN

REV	DETAILS	DRAWN	CHECKED	DATE
A	Changes to 4th arm alignment thru Lancing College Nursery	DLB	PW	17.06.20
B	The Drive/Coombes Rd junction re-prioritised; NMU link added to A27	DLB	PW	30.06.20
C	Proposed footpath between The Drive and Coombes Rd removed	DLB	PW	7.07.20
D	Traffic calming features, eg. gateways, colour marks added to 4th arm	DLB	PW	5.08.20
E	Alignment adjusted to topo survey; speed cushion added outside LCN	DLB	PW	8.09.20
F	Build-outs amended for staggered priority to 4th arm	DLB	PW	12.10.20
G	Anti-dazzle screen added between 4th arm and A27 EB reserve	DLB	PW	18.12.20
H	Amendments to 4th arm proposed traffic calming measures	DLB	PW	6.04.21
J	'keep clear' markings added to circ adjacent 4th arm entry	DLB	PW	26.05.21

Summary of junction performance

	AM							PM						
	Queue (Veh)	Delay (s)	RFC	LOS	Junction Delay (s)	Junction LOS	Network Residual Capacity	Queue (Veh)	Delay (s)	RFC	LOS	Junction Delay (s)	Junction LOS	Network Residual Capacity
	2033 Base incl permitted													
1 - A27 East	337.8	505.90	1.25	F	854.86	F	-34 % [2 - A2025 Grinstead Ln]	446.1	648.62	1.30	F	675.41	F	-28 % [3 - A27 West]
2 - A2025 Grinstead Ln	540.9	2124.63	1.72	F				7.2	36.44	0.89	E			
3 - A27 West	361.6	634.27	1.29	F				511.8	968.59	1.45	F			
4 - Manor Road	22.9	176.09	1.06	F				1.1	16.43	0.53	C			

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

NOTES

1. PRELIMINARY DESIGN PROVIDED FOR ILLUSTRATIVE PURPOSES ONLY. ALL DETAILS ARE SUBJECT TO INCLUDING CHECKING STATATORY SERVICE APPARATUS.
2. DO NOT SCALE FROM THIS DRAWING.
3. BACKGROUND PLAN IS BASED UPON A DIGITAL OSBASE.
4. ALL DETAILS TO BE CONFIRMED ON SITE AND ON A TOPOGRAPHICAL SURVEY.
5. ALL TRACKS ASSUME GRADIENTS AND CAMBERS DO NOT EXCEED 1:60 AND 1:40 RESPECTIVELY OTHERWISE VEHICLE MANOEUVRABILITY MAY BE AFFECTED.
6. ALL LAND OWNERSHIP DETAILS, EXTENT OF ADOPTED HIGHWAY AND RIGHTS OF WAY TO BE CONFIRMED.
7. ASSUMES ALL LANDSCAPING CAN BE ALTERED AND NO TREES ARE SUBJECT TO TPO.

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

NOTE OF MEETING

Subject:	Shoreham Cement Works		
Location:	MS Teams		
Date:	1st December 2021	Time:	12:30 – 14:00
ADL Ref:	ADL/AP/ls/5201		

In Attendance:	SDNPA	-	Lucy Howard (LH)
	SDNPA	-	Alex Pringle (AP)
	WSCC	-	Guy Parfect (GP)
	WSCC	-	Olamide Olayinka (OO)
	ADL	-	Amol Pisal (AP)
	ADL	-	Alex Painting (AEP)

1. A27 – merge and diverge lane capacity assessment to be undertaken.

2. Assessment should include sustainable transport mitigation impacts on the junctions. These mitigations could be in the form of increase in bus frequency, direct bus services (or with one change to neighbouring towns), bus stops on site and improvement to pedestrian/cycle track to South Downs Path.

3. Reduction in vehicular trips as a result of sustainable transport mitigation to be taken into account. Based on Sustainable Travel Towns, this could account for 2% to 4% in reduction in trips. Guy confirmed that this has been adopted in Local Plan studies in West Sussex.

   ADL proposed to discount 2% of proposed development trips across the surveyed junctions.

4. AP confirmed that except for Lancing Manor Roundabout highway improvements, all other junction improvements are within adopted highway.

5. Sustainable Transport Mitigation should be those that the development would actually be able to provide. The development should not be dependent on possible measures that are likely to be put forward by third parties.

6. Modelling assessment should be based on RFCs, queues and average delay per vehicle, and not junction RFCs and Queues.

7. Guy stated that drivers tend to notice delay over 30 seconds. Delay over 2 minutes represents a congested situation and one should avoid delay over 3 minutes.

8. Whilst increase in delays on Washington Roundabout as a result of SCW developments is marginal it is a key junction and hence WSCC would expect this junction to be improved.

APPENDIX 1.10
NOTES OF MEETING:
TECHNICAL NOTE 3

9. WSCC are working on their own scheme at Washington Roundabout and a proportion of contribution as per the cost estimate within TN3 should be allocated towards.

10. Guy confirmed that there would be no need to improve the A283/Water Lane crossroads as any improvements are likely to result in an increase in rat-running along Water Lane which would not be desirable.

11. A283 staggered junction with B2135 and Horsham Road to be assessed. Guy to provide traffic flows from strategic model. Would be included in next iteration of TN3.

12. Cost estimates to include optimism bias.

13. Guy confirmed that WSCC would not be looking to make any physical improvements to the urban roundabouts to the south of the A27 i.e. A283/Upper Shoreham Road and A283/A259. The contribution stated in TN3 towards the physical improvements could be put forward towards improving sustainable transport infrastructure in the area instead.

14. Site access – a meeting is to be held on 8th December with the SDNPA to discuss site access options, with a view to discussing a three-armed roundabout option.

15. A three-armed roundabout option would only provide access to the eastern part of the site. Therefore, based on ADL's initial assessment, there will be a need for a second three-armed roundabout access for the western part of the site.

16. There is an option to provide left in left out junction for western part of the site instead of three-armed roundabout. But this would require widening of the tunnel. Calculating the cost implications of widening of the tunnel is beyond ADL's scope of works.

TECHNICAL NOTE 4

SHOREHAM CEMENT WORKS

A27 MERGE/DIVERGE ASSESSMENT

(ADL REF: 5201, 07th DECEMBER 2021)

REVISION A

Merge/Diverge Layout Requirement Assessment

The merge/diverge capacity assessment has been undertaken in accordance with CD122 Geometric design of grade-separated junction.

The methodology adopted has been to consider whether current merge and diverge layout at the A27 slip roads are able to accommodate future flows for the 2033 Baseline Scenario and all four scenarios associated with Shoreham Cement Works project, in their current configuration or whether alternative configurations are required.

The merge/diverge design classification are categorised in alphabetical order based on the relationship between mainline volume of traffic against the merge/diverge volume of traffic; with layout Option A being the simplest design, accommodating minor merge/diverge flows, whilst layout Option B being the complex design, accommodating high levels of merge/diverge flows.

Table A shows the flows for the A27 slip roads.

Table A A27 Merge/Diverge Flows

Approach	Direction	2033 Baseline Case		SCW Scenario 1		Scenario 2		Scenario 3		Scenario 4	
		AM	PM	AM	PM	AM	PM	AM	PM	AM	PM
E/B Diverge	Mainline	2620	2493	2620	2493	2620	2493	2620	2493	2620	2493
	Diverge	484	455	556	509	552	495	512	490	552	472
E/B Merge	Mainline	2620	2493	2620	2493	2620	2493	2620	2493	2620	2493
	Merge	1217	990	1292	1049	1271	1042	1260	1037	1244	1043
W/B Diverge	Mainline	2386	2415	2386	2415	2386	2415	2386	2415	2386	2415
	Diverge	949	1598	1013	1659	1004	1642	980	1641	999	1617
W/B Merge	Mainline	2386	2415	2386	2415	2386	2415	2386	2415	2386	2415
	Merge	461	440	541	545	525	539	500	499	491	506

ADL House, Oaklands Business Park, Armstrong Way, Yate, Bristol BS37 5NA | Tel: 01454 332 100 | Email: info@adltraffic.co.uk | Web: www.adltraffic.co.uk
Company No. 3121125 | VAT Registration No. 674 4017 36

The results of the assessment for the A27 merge/diverge layout requirements are summarised in **Table B** and in **Appendix A**.

Table B A27 Merge/Diverge Assessment

Approach	Existing Layout	2033 Baseline Case		Scenario 1		Scenario 2		Scenario 3		Scenario 4	
		AM	PM	AM	PM	AM	PM	AM	PM	AM	PM
E/B Diverge	A	A	A	A	A	A	A	A	A	A	A
E/B Merge	D	E	D	E	D	E	D	E	D	E	D
W/B Diverge	C	C	D	C	D	C	D	C	D	C	D
W/B Merge	B	A	A	A	A	A	A	A	A	A	A

Table B shows that eastbound diverge is appropriately designed to accommodate both baseline flows (which comprise Local Plan allocation flows, committed development flows and background traffic growth), as well as all four development scenarios associated with the Shoreham Cement Works Study.

Table B also shows that the eastbound merge which is currently designed as lane gain layout (Layout D) would need to be modified to accommodate lane gain with a ghost island with either an offside or nearside merge in AM peak hour. It should however be noted that this mitigation is required in both 2033 baseline scenarios as well as SCW development scenarios. In PM peak hour, the existing layout appears to be of higher provision than the required layout.

Similarly, westbound diverge appears to require an upgrade from its current 'lane drop with 1-lane connection road' type arrangement (i.e., layout Option C) to a ghost island lane drop type arrangement (i.e., layout Option D) in both 2033 baseline scenario and SCW development scenarios in PM peak hour. In AM peak hour, the existing layout appears to have appropriate provision.

The westbound merge appears to be designed to a higher provision i.e., parallel merge (Layout B) than what is required.

As such, **Table B** demonstrates that the required merge/diverge type does not alter between the 2033 baseline scenario and SCW development scenarios i.e., SCW development scenarios do not require any mitigation over and above what would be required for the 2033 baseline scenario.

Follow Up Flag: Follow up
Flag Status: Completed

Hi Amol and all

I have now obtained advice from Henry Moyo in the County Council's highways team regarding this. Henry says:

"I have had the opportunity to review your email below and its attachments and I have the following comments.

If they haven't already done so, National Highways will need to provide written confirmation that they are happy for WSCC to review the design, including on lengths of road that are under their jurisdiction. Do we need to offer them the final version of what we accept for them to formally accept it as well so that both WSCC and National Highways are in agreement at the planning application stage and beyond? I suspect NH will be consultees as well at the planning application stage.

Initial comments are as follows.

- I note that the designers used the speed limit to calculate forward visibility. In my view, the SSD should be judged against the speed that cars are driving due to the curvature – see Equation from Annex B of "Provision of Road Restraint Systems on Local Authority Roads" UK Roads Liaison Group and DfT 2011. It is unlikely that motorists will be driving at national speed limit on the slip roads. Alternatively, measured speeds might inform the design.
- The designers will need to review accidents statistics at the roundabout and their possible causes. There appears to be a few injury accidents which are almost exclusively to do with the shallow entry angles. Approaching drivers are looking over their shoulders at circulating traffic to anticipate their go/no-go decision and then colliding with drivers waiting at the give way line. This could be effectively countered by the use of visibility screening at arms 1, 3 and 4 like the ones WSCC installed at A24 Southwater. Drivers would then be more likely to look where they are going until they are much closer to the give way line. I note that the proposals for Arm 2 provide a major improvement in entry angle to the extent that such screening is not necessary here. However, let's let the designer decide what measures they propose to counter accidents they will identify after analysing the accident trends.

- Looking at the Design Audit spreadsheet, the designers seem to have captured most of them and I haven't picked up additional ones. However, what they have not provided is a plan that shows the available forward visibility splays and the required splays. They will also need to identify the constraints that stand in the way of achieving the required forward visibility splays.

- In my view, the road safety audit needs to be undertaken and submitted to us to inform the design review.

See further comments below in red."

[GP text to HM in black; HM response in red]

For the A283/A27 slips roundabout ADL have identified the following departures:
Arm 3 Exit kerb radius to A27 SE – as existing: straight – this is an existing situation. No accidents here so we can't see a problem with this
Visibility on approach:
Arm 1 A283 NW Existing improved from 78m to 94m - The accidents at this arm are attributable to the substandard entry angle. Possibly install visibility screening but designers to analyse accidents and work out what measures can be incorporated.
Arm 2 A27 NE Doesn't meet requirement for SSD to comply with CD109 which for derestricted dual carriageway road is 295m (one step 215m) & reduced on existing 107m by 11m to 96m: but approach speeds constrained by earlier bends – ADL propose transverse yellow markings - The accidents at this arm are attributable to the substandard entry angle. Possibly install visibility screening. SSD should be judged against the speed that cars are driving due to the curvature – see Equation from Annex B of "Provision of Road Restraint Systems on Local Authority Roads" UK Roads Liaison Group and DfT 2011
Arm 3 A27 SE Doesn't meet requirement for SSD to comply with CD109 which for derestricted dual carriageway road is 295m (one step 215m) but increased on existing 50m by 19m to 69.4m: approach speeds constrained by earlier bends - SSD should be judged against the speed that cars are driving due to the curvature as above. The accidents at this arm are attributable to the substandard entry angle. Possibly install visibility screening.

I hope that this is helpful in advising how to bring the proposals forward.

Kind regards

Guy

Subject: CD116 Compliance Checks

Dear All

As you know, yesterday we emailed you on the validation of A283/A27 slips roundabout. We would greatly appreciated a response from you at your earliest convenience due to the AAP timescales.

This email is regarding the CD116 compliance checks.

Please see attached the following:

- Geometric Design Check spreadsheet which contains 2 tabs – one for A27/Grinstead Lane roundabout and the other for A283/A27 slips roundabout
- Drawing 5201-GP-07C which shows our proposed improvements to the A283/A27 slips roundabout
- Drawing 5201-GP-10D which shows our proposed improvements to the A27/Grinstead Lane roundabout

As you will see, our roundabout improvements meet CD116 requirement for the majority of the parameters. For others, we have demonstrated that we would not be worsening the junction safety when compared to the existing situation (for A283/A27 slips roundabout) and to the permitted NMF's scheme for A27/Grinstead Lane roundabout.

Also attached is my email to you all of 7th December 2021 which contains our A27 merge/diverge assessment using CD123 guidance.

We consider that as these are outline drawings for the initial AAP assessment, we consider that Stage 1 RSA and WCHAR could be undertaken either at individual planning application stage or the later stage of AAP. I believe that similar approach was taken for Horsham Transport Study (Local Plan Preferred Scenario Transport Assessment) which was prepared in May 2021.

As always, a speedy response to the above would be most appreciated. Happy to discuss any aspect of this email over the phone. My mobile number is provided in the email signature.

Many thanks.

Kind regards

Amol Pisal | Managing Director

3.10 Pedestrian location..Not a pedestrian
3.11 Pedestrian movement..Not a pedestrian
3.19 Roadworker injured...No

APPENDIX 5.0

PERMITTED TRIP GENERATION

Calculation Reference: AUDIT-733701-210725-0756

TRIP RATE CALCULATION SELECTION PARAMETERS:

Land Use : 15 - VEHICLE SERVICES
Category : A - VEHICLE REPAIR GARAGE (SLOW FIT)
TOTAL VEHICLES

Selected regions and areas:

02	SOUTH EAST		
	HF	HERTFORDSHIRE	1 days
04	EAST ANGLIA		
	CA	CAMBRIDGESHIRE	1 days
05	EAST MIDLANDS		
	LE	LEICESTERSHIRE	2 days
	LN	LINCOLNSHIRE	1 days
06	WEST MIDLANDS		
	WO	WORCESTERSHIRE	1 days
07	YORKSHIRE & NORTH LINCOLNSHIRE		
	WY	WEST YORKSHIRE	1 days
09	NORTH		
	TW	TYNE & WEAR	1 days

This section displays the number of survey days per TRICS® sub-region in the selected set

Primary Filtering selection:

This data displays the chosen trip rate parameter and its selected range. Only sites that fall within the parameter range are included in the trip rate calculation.

Parameter: Gross floor area
Actual Range: 290 to 5100 (units: sqm)
Range Selected by User: 136 to 5100 (units: sqm)

Parking Spaces Range: All Surveys Included

Public Transport Provision:
Selection by: Include all surveys

Date Range: 01/01/00 to 28/06/19

This data displays the range of survey dates selected. Only surveys that were conducted within this date range are included in the trip rate calculation.

Selected survey days:

Tuesday	2 days
Wednesday	2 days
Thursday	2 days
Friday	2 days

This data displays the number of selected surveys by day of the week.

Selected survey types:

Manual count	8 days
Directional ATC Count	0 days

This data displays the number of manual classified surveys and the number of unclassified ATC surveys, the total adding up to the overall number of surveys in the selected set. Manual surveys are undertaken using staff, whilst ATC surveys are undertaking using machines.

Selected Locations:

Edge of Town	8

This data displays the number of surveys per main location category within the selected set. The main location categories consist of Free Standing, Edge of Town, Suburban Area, Neighbourhood Centre, Edge of Town Centre, Town Centre and Not Known.

Selected Location Sub Categories:

Industrial Zone	4
Commercial Zone	1
Residential Zone	2
No Sub Category	1

APPENDIX 5.1
TRICS: VEHICLE REPAIR GARAGES

This data displays the number of surveys per location sub-category within the selected set. The location sub-categories consist of Commercial Zone, Industrial Zone, Development Zone, Residential Zone, Retail Zone, Built-Up Zone, Village, Out of Town, High Street and No Sub Category.

Secondary Filtering selection:

Use Class:

Not Known	8 days

This data displays the number of surveys per Use Class classification within the selected set. The Use Classes Order 2005 has been used for this purpose, which can be found within the Library module of TRICS®.

Population within 500m Range:

All Surveys Included

Population within 1 mile:

1,001 to 5,000	1 days
5,001 to 10,000	3 days
10,001 to 15,000	2 days
15,001 to 20,000	2 days

This data displays the number of selected surveys within stated 1-mile radii of population.

Population within 5 miles:

25,001 to 50,000	1 days
50,001 to 75,000	1 days
100,001 to 125,000	1 days
125,001 to 250,000	2 days
250,001 to 500,000	3 days

This data displays the number of selected surveys within stated 5-mile radii of population.

Car ownership within 5 miles:

0.6 to 1.0	4 days
1.1 to 1.5	4 days

This data displays the number of selected surveys within stated ranges of average cars owned per residential dwelling, within a radius of 5-miles of selected survey sites.

Travel Plan:

Not Known	1 days
No	7 days

This data displays the number of surveys within the selected set that were undertaken at sites with Travel Plans in place, and the number of surveys that were undertaken at sites without Travel Plans.

PTAL Rating:

No PTAL Present	8 days

This data displays the number of selected surveys with PTAL Ratings.

22:00 - 23:00									
23:00 - 24:00									
Total Rates:			9.358			9.189			18.547

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

*To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.*

Parameter summary

Trip rate parameter range selected:	290 - 5100 (units: sqm)
Survey date date range:	01/01/00 - 28/06/19
Number of weekdays (Monday-Friday):	8
Number of Saturdays:	0
Number of Sundays:	0
Surveys automatically removed from selection:	0
Surveys manually removed from selection:	0

This section displays a quick summary of some of the data filtering selections made by the TRICS® user. The trip rate calculation parameter range of all selected surveys is displayed first, followed by the range of minimum and maximum survey dates selected by the user. Then, the total number of selected weekdays and weekend days in the selected set of surveys are show. Finally, the number of survey days that have been manually removed from the selected set outside of the standard filtering procedure are displayed.

Primary Filtering selection:

This data displays the chosen trip rate parameter and its selected range. Only sites that fall within the parameter range are included in the trip rate calculation.

Parameter: Gross floor area
Actual Range: 190 to 37530 (units: sqm)
Range Selected by User: 190 to 80066 (units: sqm)

Parking Spaces Range: All Surveys Included

Public Transport Provision:
Selection by: Include all surveys

Date Range: 01/01/13 to 25/11/20

This data displays the range of survey dates selected. Only surveys that were conducted within this date range are included in the trip rate calculation.

Selected survey days:

Monday	2 days
Wednesday	1 days
Thursday	2 days
Friday	5 days

This data displays the number of selected surveys by day of the week.

Selected survey types:

Manual count	10 days
Directional ATC Count	0 days

This data displays the number of manual classified surveys and the number of unclassified ATC surveys, the total adding up to the overall number of surveys in the selected set. Manual surveys are undertaken using staff, whilst ATC surveys are undertaking using machines.

Selected Locations:

Edge of Town	10

This data displays the number of surveys per main location category within the selected set. The main location categories consist of Free Standing, Edge of Town, Suburban Area, Neighbourhood Centre, Edge of Town Centre, Town Centre and Not Known.

Selected Location Sub Categories:

Industrial Zone	9
Commercial Zone	1

APPENDIX 5.2
TRICS: COMMERCIAL WAREHOUSING

This data displays the number of surveys per location sub-category within the selected set. The location sub-categories consist of Commercial Zone, Industrial Zone, Development Zone, Residential Zone, Retail Zone, Built-Up Zone, Village,

Secondary Filtering selection:

Use Class:

n/a	2 days
B8	8 days

This data displays the number of surveys per Use Class classification within the selected set. The Use Classes Order 2005 has been used for this purpose, which can be found within the Library module of TRICS®.

Filter by Site Operations Breakdown:
All Surveys Included

Population within 500m Range:
All Surveys Included

Population within 1 mile:

1,000 or Less	1 days
1,001 to 5,000	1 days
5,001 to 10,000	3 days
10,001 to 15,000	1 days
15,001 to 20,000	2 days
20,001 to 25,000	1 days
25,001 to 50,000	1 days

This data displays the number of selected surveys within stated 1-mile radii of population.

Population within 5 miles:

5,001 to 25,000	1 days
75,001 to 100,000	1 days
100,001 to 125,000	1 days
125,001 to 250,000	4 days
250,001 to 500,000	2 days
500,001 or More	1 days

This data displays the number of selected surveys within stated 5-mile radii of population.

Car ownership within 5 miles:

0.6 to 1.0	4 days
1.1 to 1.5	6 days

This data displays the number of selected surveys within stated ranges of average cars owned per residential dwelling, within a radius of 5-miles of selected survey sites.

Travel Plan:

No	10 days

This data displays the number of surveys within the selected set that were undertaken at sites with Travel Plans in place, and the number of surveys that were undertaken at sites without Travel Plans.

PTAL Rating:

No PTAL Present	10 days

This data displays the number of selected surveys with PTAL Ratings.

Covid-19 Restrictions	Yes	At least one survey within the selected data set was undertaken at a time of Covid-19 restrictions

21:00 - 22:00									
22:00 - 23:00									
23:00 - 24:00									
Total Rates:			2.101			2.053			4.154

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

*To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.*

Parameter summary

Trip rate parameter range selected:	190 - 37530 (units: sqm)
Survey date date range:	01/01/13 - 25/11/20
Number of weekdays (Monday-Friday):	10
Number of Saturdays:	0
Number of Sundays:	0
Surveys automatically removed from selection:	0
Surveys manually removed from selection:	0

This section displays a quick summary of some of the data filtering selections made by the TRICS® user. The trip rate calculation parameter range of all selected surveys is displayed first, followed by the range of minimum and maximum survey dates selected by the user. Then, the total number of selected weekdays and weekend days in the selected set of surveys are show. Finally, the number of survey days that have been manually removed from the selected set outside of the standard filtering procedure are displayed.

TRIP RATE CALCULATION SELECTION PARAMETERS:

Land Use : 02 - EMPLOYMENT
Category : C - INDUSTRIAL UNIT
TOTAL VEHICLES

Selected regions and areas:

02	SOUTH EAST		
	HC	HAMPSHIRE	1 days
03	SOUTH WEST		
	BR	BRISTOL CITY	1 days
04	EAST ANGLIA		
	SF	SUFFOLK	1 days
06	WEST MIDLANDS		
	HE	HEREFORDSHIRE	1 days
08	NORTH WEST		
	LC	LANCASHIRE	1 days
09	NORTH		
	CB	CUMBRIA	1 days
11	SCOTLAND		
	SR	STIRLING	1 days

This section displays the number of survey days per TRICS® sub-region in the selected set

Primary Filtering selection:

This data displays the chosen trip rate parameter and its selected range. Only sites that fall within the parameter range are included in the trip rate calculation.

Parameter: Gross floor area
Actual Range: 1010 to 3000 (units: sqm)
Range Selected by User: 500 to 4000 (units: sqm)

Parking Spaces Range: All Surveys Included

Public Transport Provision:
Selection by: Include all surveys

Date Range: 01/01/13 to 22/10/20

This data displays the range of survey dates selected. Only surveys that were conducted within this date range are included in the trip rate calculation.

Selected survey days:

Monday	1 days
Tuesday	3 days
Thursday	2 days
Friday	1 days

This data displays the number of selected surveys by day of the week.

Selected survey types:

Manual count	7 days
Directional ATC Count	0 days

This data displays the number of manual classified surveys and the number of unclassified ATC surveys, the total adding up to the overall number of surveys in the selected set. Manual surveys are undertaken using staff, whilst ATC surveys are undertaking using machines.

Selected Locations:

Edge of Town	7

This data displays the number of surveys per main location category within the selected set. The main location categories consist of Free Standing, Edge of Town, Suburban Area, Neighbourhood Centre, Edge of Town Centre, Town Centre and Not Known.

Selected Location Sub Categories:

Industrial Zone	6
Commercial Zone	1

APPENDIX 5.3
TRICS: INDUSTRIAL UNIT

This data displays the number of surveys per location sub-category within the selected set. The location sub-categories consist of Commercial Zone, Industrial Zone, Development Zone, Residential Zone, Retail Zone, Built-Up Zone, Village, Out of Town, High Street and No Sub Category.

Secondary Filtering selection:

Use Class:

Not Known	7 days

This data displays the number of surveys per Use Class classification within the selected set. The Use Classes Order 2005 has been used for this purpose, which can be found within the Library module of TRICS®.

Filter by Site Operations Breakdown:
All Surveys Included

Population within 500m Range:
All Surveys Included

Population within 1 mile:

1,001 to 5,000	1 days
5,001 to 10,000	2 days
10,001 to 15,000	2 days
20,001 to 25,000	1 days
25,001 to 50,000	1 days

This data displays the number of selected surveys within stated 1-mile radii of population.

Population within 5 miles:

5,001 to 25,000	1 days
50,001 to 75,000	1 days
75,001 to 100,000	2 days
100,001 to 125,000	1 days
125,001 to 250,000	1 days
250,001 to 500,000	1 days

This data displays the number of selected surveys within stated 5-mile radii of population.

Car ownership within 5 miles:

1.1 to 1.5	7 days

This data displays the number of selected surveys within stated ranges of average cars owned per residential dwelling, within a radius of 5-miles of selected survey sites.

Travel Plan:

No	7 days

This data displays the number of surveys within the selected set that were undertaken at sites with Travel Plans in place, and the number of surveys that were undertaken at sites without Travel Plans.

PTAL Rating:

No PTAL Present	7 days

This data displays the number of selected surveys with PTAL Ratings.

Total Rates:			3.219			2.986			6.205

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

*To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.*

Parameter summary

Trip rate parameter range selected:	1010 - 3000 (units: sqm)
Survey date date range:	01/01/13 - 22/10/20
Number of weekdays (Monday-Friday):	7
Number of Saturdays:	0
Number of Sundays:	0
Surveys automatically removed from selection:	0
Surveys manually removed from selection:	1

This section displays a quick summary of some of the data filtering selections made by the TRICS® user. The trip rate calculation parameter range of all selected surveys is displayed first, followed by the range of minimum and maximum survey dates selected by the user. Then, the total number of selected weekdays and weekend days in the selected set of surveys are show. Finally, the number of survey days that have been manually removed from the selected set outside of the standard filtering procedure are displayed.

PROPOSED TRIP GENERATION

Calculation Reference: AUDIT-733701-210724-0705

TRIP RATE CALCULATION SELECTION PARAMETERS:

Land Use : 03 - RESIDENTIAL
Category : A - HOUSES PRIVATELY OWNED
MULTI-MODAL TOTAL VEHICLES

Selected regions and areas:

02	SOUTH EAST		
	ES	EAST SUSSEX	3 days
	KC	KENT	2 days
	SC	SURREY	1 days
05	EAST MIDLANDS		
	DS	DERBYSHIRE	1 days
06	WEST MIDLANDS		
	SH	SHROPSHIRE	1 days
	ST	STAFFORDSHIRE	1 days
07	YORKSHIRE & NORTH LINCOLNSHIRE		
	NE	NORTH EAST LINCOLNSHIRE	1 days
	NY	NORTH YORKSHIRE	1 days
09	NORTH		
	DH	DURHAM	1 days

This section displays the number of survey days per TRICS® sub-region in the selected set

Primary Filtering selection:

This data displays the chosen trip rate parameter and its selected range. Only sites that fall within the parameter range are included in the trip rate calculation.

Parameter: No of Dwellings
Actual Range: 54 to 432 (units:)
Range Selected by User: 50 to 600 (units:)

Parking Spaces Range: All Surveys Included

Parking Spaces per Dwelling Range: All Surveys Included

Bedrooms per Dwelling Range: All Surveys Included

Percentage of dwellings privately owned: All Surveys Included

Public Transport Provision:
Selection by: Include all surveys

Date Range: 01/01/13 to 08/10/20

This data displays the range of survey dates selected. Only surveys that were conducted within this date range are included in the trip rate calculation.

Selected survey days:

Monday	2 days
Tuesday	2 days
Wednesday	3 days
Thursday	2 days
Friday	3 days

This data displays the number of selected surveys by day of the week.

Selected survey types:

Manual count	12 days
Directional ATC Count	0 days

This data displays the number of manual classified surveys and the number of unclassified ATC surveys, the total adding up to the overall number of surveys in the selected set. Manual surveys are undertaken using staff, whilst ATC surveys are undertaking using machines.

APPENDIX 9.1
TRICS: RESIDENTIAL

Selected Locations:

Edge of Town	12

This data displays the number of surveys per main location category within the selected set. The main location categories consist of Free Standing, Edge of Town, Suburban Area, Neighbourhood Centre, Edge of Town Centre, Town Centre and Not Known.

Selected Location Sub Categories:

Residential Zone	10

This data displays the number of surveys per location sub-category within the selected set. The location sub-categories consist of Commercial Zone, Industrial Zone, Development Zone, Residential Zone, Retail Zone, Built-Up Zone, Village, Out of Town, High Street and No Sub Category.

Secondary Filtering selection:

Use Class:

C3	12 days

This data displays the number of surveys per Use Class classification within the selected set. The Use Classes Order 2005 has been used for this purpose, which can be found within the Library module of TRICS®.

Population within 500m Range:

All Surveys Included

Population within 1 mile:

1,000 or Less	1 days
5,001 to 10,000	3 days
10,001 to 15,000	6 days
15,001 to 20,000	2 days

This data displays the number of selected surveys within stated 1-mile radii of population.

Population within 5 miles:

5,001 to 25,000	1 days
25,001 to 50,000	1 days
50,001 to 75,000	2 days
75,001 to 100,000	2 days
100,001 to 125,000	1 days
125,001 to 250,000	5 days

This data displays the number of selected surveys within stated 5-mile radii of population.

Car ownership within 5 miles:

0.6 to 1.0	3 days
1.1 to 1.5	9 days

This data displays the number of selected surveys within stated ranges of average cars owned per residential dwelling, within a radius of 5-miles of selected survey sites.

Travel Plan:

No	12 days

This data displays the number of surveys within the selected set that were undertaken at sites with Travel Plans in place, and the number of surveys that were undertaken at sites without Travel Plans.

PTAL Rating:

No PTAL Present	12 days

This data displays the number of selected surveys with PTAL Ratings.

Total Rates:			2.215			2.232			4.447

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

*To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.*

Parameter summary

Trip rate parameter range selected:	54 - 432 (units:)
Survey date date range:	01/01/13 - 08/10/20
Number of weekdays (Monday-Friday):	12
Number of Saturdays:	0
Number of Sundays:	0
Surveys automatically removed from selection:	0
Surveys manually removed from selection:	0

This section displays a quick summary of some of the data filtering selections made by the TRICS® user. The trip rate calculation parameter range of all selected surveys is displayed first, followed by the range of minimum and maximum survey dates selected by the user. Then, the total number of selected weekdays and weekend days in the selected set of surveys are show. Finally, the number of survey days that have been manually removed from the selected set outside of the standard filtering procedure are displayed.

Total Rates:			3.898			3.956			7.854

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

*To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.*

Calculation Reference: AUDIT-733701-210724-0741

TRIP RATE CALCULATION SELECTION PARAMETERS:

Land Use : 02 - EMPLOYMENT
Category : D - INDUSTRIAL ESTATE
MULTI-MODAL TOTAL VEHICLES

Selected regions and areas:

06	WEST MIDLANDS		
	WK	WARWICKSHIRE	2 days
	WO	WORCESTERSHIRE	1 days
07	YORKSHIRE & NORTH LINCOLNSHIRE		
	NY	NORTH YORKSHIRE	1 days
11	SCOTLAND		
	AG	ANGUS	1 days

This section displays the number of survey days per TRICS® sub-region in the selected set

Primary Filtering selection:

This data displays the chosen trip rate parameter and its selected range. Only sites that fall within the parameter range are included in the trip rate calculation.

Parameter: Gross floor area
Actual Range: 20860 to 150564 (units: sqm)
Range Selected by User: 20000 to 974258 (units: sqm)

Parking Spaces Range: All Surveys Included

Public Transport Provision:
Selection by: Include all surveys

Date Range: 01/01/13 to 26/09/19

This data displays the range of survey dates selected. Only surveys that were conducted within this date range are included in the trip rate calculation.

Selected survey days:

Tuesday	3 days
Wednesday	1 days
Thursday	1 days

This data displays the number of selected surveys by day of the week.

Selected survey types:

Manual count	5 days
Directional ATC Count	0 days

This data displays the number of manual classified surveys and the number of unclassified ATC surveys, the total adding up to the overall number of surveys in the selected set. Manual surveys are undertaken using staff, whilst ATC surveys are undertaking using machines.

Selected Locations:

Edge of Town	5

This data displays the number of surveys per main location category within the selected set. The main location categories consist of Free Standing, Edge of Town, Suburban Area, Neighbourhood Centre, Edge of Town Centre, Town Centre and Not Known.

Selected Location Sub Categories:

Industrial Zone	2
Out of Town	2
No Sub Category	1

This data displays the number of surveys per location sub-category within the selected set. The location sub-categories consist of Commercial Zone, Industrial Zone, Development Zone, Residential Zone, Retail Zone, Built-Up Zone, Village, Out of Town, High Street and No Sub Category.

APPENDIX 9.2
TRICS: EMPLOYMENT

Secondary Filtering selection:

Use Class:

Not Known	5 days

This data displays the number of surveys per Use Class classification within the selected set. The Use Classes Order 2005 has been used for this purpose, which can be found within the Library module of TRICS®.

Filter by Site Operations Breakdown:
All Surveys Included

Population within 500m Range:
All Surveys Included

Population within 1 mile:

5,001 to 10,000	3 days
10,001 to 15,000	1 days
20,001 to 25,000	1 days

This data displays the number of selected surveys within stated 1-mile radii of population.

Population within 5 miles:

25,001 to 50,000	3 days
75,001 to 100,000	1 days
125,001 to 250,000	1 days

This data displays the number of selected surveys within stated 5-mile radii of population.

Car ownership within 5 miles:

1.1 to 1.5	5 days

This data displays the number of selected surveys within stated ranges of average cars owned per residential dwelling, within a radius of 5-miles of selected survey sites.

Travel Plan:

No	5 days

This data displays the number of surveys within the selected set that were undertaken at sites with Travel Plans in place, and the number of surveys that were undertaken at sites without Travel Plans.

PTAL Rating:

No PTAL Present	5 days

This data displays the number of selected surveys with PTAL Ratings.

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

*To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.*

Parameter summary

Trip rate parameter range selected:	20860 - 150564 (units: sqm)
Survey date date range:	01/01/13 - 26/09/19
Number of weekdays (Monday-Friday):	5
Number of Saturdays:	0
Number of Sundays:	0
Surveys automatically removed from selection:	0
Surveys manually removed from selection:	2

This section displays a quick summary of some of the data filtering selections made by the TRICS® user. The trip rate calculation parameter range of all selected surveys is displayed first, followed by the range of minimum and maximum survey dates selected by the user. Then, the total number of selected weekdays and weekend days in the selected set of surveys are show. Finally, the number of survey days that have been manually removed from the selected set outside of the standard filtering procedure are displayed.

20:00 - 21:00	1	20860	0.000	1	20860	0.000	1	20860	0.000
21:00 - 22:00									
22:00 - 23:00									
23:00 - 24:00									
Total Rates:			0.054			0.053			0.107

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

*To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.*

Calculation Reference: AUDIT-733701-210724-0736

TRIP RATE CALCULATION SELECTION PARAMETERS:

Land Use : 01 - RETAIL
Category : O - CONVENIENCE STORE
MULTI-MODAL TOTAL VEHICLES

Selected regions and areas:

02	SOUTH EAST		
	ES	EAST SUSSEX	1 days
03	SOUTH WEST		
	BA	BATH & NORTH EAST SOMERSET	1 days
	DC	DORSET	1 days
	WL	WILTSHIRE	1 days
04	EAST ANGLIA		
	NF	NORFOLK	1 days
11	SCOTLAND		
	FA	FALKIRK	1 days

This section displays the number of survey days per TRICS® sub-region in the selected set

Primary Filtering selection:

This data displays the chosen trip rate parameter and its selected range. Only sites that fall within the parameter range are included in the trip rate calculation.

Parameter: Gross floor area
Actual Range: 165 to 300 (units: sqm)
Range Selected by User: 100 to 300 (units: sqm)

Parking Spaces Range: All Surveys Included

Public Transport Provision:
Selection by: Include all surveys

Date Range: 01/01/00 to 25/09/19

This data displays the range of survey dates selected. Only surveys that were conducted within this date range are included in the trip rate calculation.

Selected survey days:

Monday	1 days
Wednesday	1 days
Friday	4 days

This data displays the number of selected surveys by day of the week.

Selected survey types:

Manual count	6 days
Directional ATC Count	0 days

This data displays the number of manual classified surveys and the number of unclassified ATC surveys, the total adding up to the overall number of surveys in the selected set. Manual surveys are undertaken using staff, whilst ATC surveys are undertaking using machines.

Selected Locations:

Suburban Area (PPS6 Out of Centre)	6

This data displays the number of surveys per main location category within the selected set. The main location categories consist of Free Standing, Edge of Town, Suburban Area, Neighbourhood Centre, Edge of Town Centre, Town Centre and Not Known.

Selected Location Sub Categories:

Residential Zone	6

This data displays the number of surveys per location sub-category within the selected set. The location sub-categories consist of Commercial Zone, Industrial Zone, Development Zone, Residential Zone, Retail Zone, Built-Up Zone, Village, Out of Town, High Street and No Sub Category.

APPENDIX 9.3
TRICS: CONVENIENCE STORE

Secondary Filtering selection:

Use Class:

Not Known	3 days
E(a)	3 days

This data displays the number of surveys per Use Class classification within the selected set. The Use Classes Order 2005 has been used for this purpose, which can be found within the Library module of TRICS®.

Population within 500m Range:

All Surveys Included

Population within 1 mile:

15,001 to 20,000	3 days
20,001 to 25,000	1 days
25,001 to 50,000	2 days

This data displays the number of selected surveys within stated 1-mile radii of population.

Population within 5 miles:

25,001 to 50,000	1 days
75,001 to 100,000	1 days
100,001 to 125,000	2 days
125,001 to 250,000	2 days

This data displays the number of selected surveys within stated 5-mile radii of population.

Car ownership within 5 miles:

0.6 to 1.0	3 days
1.1 to 1.5	3 days

This data displays the number of selected surveys within stated ranges of average cars owned per residential dwelling, within a radius of 5-miles of selected survey sites.

Petrol filling station:

Included in the survey count	0 days
Excluded from count or no filling station	6 days

This data displays the number of surveys within the selected set that include petrol filling station activity, and the number of surveys that do not.

Travel Plan:

No	6 days

This data displays the number of surveys within the selected set that were undertaken at sites with Travel Plans in place, and the number of surveys that were undertaken at sites without Travel Plans.

PTAL Rating:

No PTAL Present	6 days

This data displays the number of selected surveys with PTAL Ratings.

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

*To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.*

Parameter summary

Trip rate parameter range selected:	165 - 300 (units: sqm)
Survey date date range:	01/01/00 - 25/09/19
Number of weekdays (Monday-Friday):	6
Number of Saturdays:	0
Number of Sundays:	0
Surveys automatically removed from selection:	0
Surveys manually removed from selection:	0

This section displays a quick summary of some of the data filtering selections made by the TRICS® user. The trip rate calculation parameter range of all selected surveys is displayed first, followed by the range of minimum and maximum survey dates selected by the user. Then, the total number of selected weekdays and weekend days in the selected set of surveys are show. Finally, the number of survey days that have been manually removed from the selected set outside of the standard filtering procedure are displayed.

Total Rates:			10.416			10.110			20.526

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

*To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.*

TRIP RATE CALCULATION SELECTION PARAMETERS:

Land Use : 06 - HOTEL, FOOD & DRINK
Category : A - HOTELS
MULTI-MODAL TOTAL VEHICLES

Selected regions and areas:

02	SOUTH EAST		
	BU	BUCKINGHAMSHIRE	1 days
03	SOUTH WEST		
	DV	DEVON	1 days
04	EAST ANGLIA		
	NF	NORFOLK	1 days
05	EAST MIDLANDS		
	LE	LEICESTERSHIRE	1 days
10	WALES		
	SW	SWANSEA	1 days
11	SCOTLAND		
	AG	ANGUS	1 days

This section displays the number of survey days per TRICS® sub-region in the selected set

Primary Filtering selection:

This data displays the chosen trip rate parameter and its selected range. Only sites that fall within the parameter range are included in the trip rate calculation.

Parameter: Gross floor area
Actual Range: 720 to 17624 (units: sqm)
Range Selected by User: 720 to 17624 (units: sqm)

Parking Spaces Range: All Surveys Included

Public Transport Provision:
Selection by: Include all surveys

Date Range: 01/01/10 to 25/11/19

This data displays the range of survey dates selected. Only surveys that were conducted within this date range are included in the trip rate calculation.

Selected survey days:

Monday	1 days
Tuesday	1 days
Wednesday	2 days
Thursday	2 days

This data displays the number of selected surveys by day of the week.

Selected survey types:

Manual count	6 days
Directional ATC Count	0 days

This data displays the number of manual classified surveys and the number of unclassified ATC surveys, the total adding up to the overall number of surveys in the selected set. Manual surveys are undertaken using staff, whilst ATC surveys are undertaking using machines.

Selected Locations:

Edge of Town	6

This data displays the number of surveys per main location category within the selected set. The main location categories consist of Free Standing, Edge of Town, Suburban Area, Neighbourhood Centre, Edge of Town Centre, Town Centre and Not Known.

Selected Location Sub Categories:

Industrial Zone	1
Commercial Zone	1
Development Zone	1
Residential Zone	1
Out of Town	1
No Sub Category	1

APPENDIX 9.4
TRICS: HOTEL

This data displays the number of surveys per location sub-category within the selected set. The location sub-categories consist of Commercial Zone, Industrial Zone, Development Zone, Residential Zone, Retail Zone, Built-Up Zone, Village, Out of Town, High Street and No Sub Category.

Secondary Filtering selection:

Use Class:

C1	6 days

This data displays the number of surveys per Use Class classification within the selected set. The Use Classes Order 2005 has been used for this purpose, which can be found within the Library module of TRICS®.

Population within 500m Range:

All Surveys Included

Population within 1 mile:

5,001 to 10,000	4 days
10,001 to 15,000	1 days
100,001 or More	1 days

This data displays the number of selected surveys within stated 1-mile radii of population.

Population within 5 miles:

25,001 to 50,000	1 days
100,001 to 125,000	1 days
125,001 to 250,000	2 days
250,001 to 500,000	2 days

This data displays the number of selected surveys within stated 5-mile radii of population.

Car ownership within 5 miles:

0.6 to 1.0	2 days
1.1 to 1.5	4 days

This data displays the number of selected surveys within stated ranges of average cars owned per residential dwelling, within a radius of 5-miles of selected survey sites.

Travel Plan:

No	6 days

This data displays the number of surveys within the selected set that were undertaken at sites with Travel Plans in place, and the number of surveys that were undertaken at sites without Travel Plans.

PTAL Rating:

No PTAL Present	6 days

This data displays the number of selected surveys with PTAL Ratings.

21:00 - 22:00	6	6911	0.121	6	6911	0.171	6	6911	0.292
22:00 - 23:00									
23:00 - 24:00									
Total Rates:			4.311			4.392			8.703

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

*To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.*

Parameter summary

Trip rate parameter range selected:	720 - 17624 (units: sqm)
Survey date date range:	01/01/10 - 25/11/19
Number of weekdays (Monday-Friday):	6
Number of Saturdays:	0
Number of Sundays:	0
Surveys automatically removed from selection:	0
Surveys manually removed from selection:	0

This section displays a quick summary of some of the data filtering selections made by the TRICS® user. The trip rate calculation parameter range of all selected surveys is displayed first, followed by the range of minimum and maximum survey dates selected by the user. Then, the total number of selected weekdays and weekend days in the selected set of surveys are show. Finally, the number of survey days that have been manually removed from the selected set outside of the standard filtering procedure are displayed.

Calculation Reference: AUDIT-733701-211001-1021

TRIP RATE CALCULATION SELECTION PARAMETERS:

Land Use : 02 - EMPLOYMENT
Category : B - BUSINESS PARK
MULTI-MODAL TOTAL VEHICLES

Selected regions and areas:

02	SOUTH EAST		
	EX	ESSEX	2 days
03	SOUTH WEST		
	DV	DEVON	1 days
04	EAST ANGLIA		
	CA	CAMBRIDGESHIRE	1 days
05	EAST MIDLANDS		
	LN	LINCOLNSHIRE	1 days
06	WEST MIDLANDS		
	ST	STAFFORDSHIRE	1 days
	WK	WARWICKSHIRE	1 days
10	WALES		
	CF	CARDIFF	3 days
11	SCOTLAND		
	AD	ABERDEEN CITY	1 days
	FA	FALKIRK	1 days

This section displays the number of survey days per TRICS® sub-region in the selected set

Primary Filtering selection:

This data displays the chosen trip rate parameter and its selected range. Only sites that fall within the parameter range are included in the trip rate calculation.

Parameter: Gross floor area
Actual Range: 1500 to 142687 (units: sqm)
Range Selected by User: 975 to 142687 (units: sqm)

Parking Spaces Range: All Surveys Included

Public Transport Provision:
Selection by: Include all surveys

Date Range: 01/01/13 to 21/11/19

This data displays the range of survey dates selected. Only surveys that were conducted within this date range are included in the trip rate calculation.

Selected survey days:

Monday	1 days
Tuesday	1 days
Wednesday	3 days
Thursday	2 days
Friday	5 days

This data displays the number of selected surveys by day of the week.

Selected survey types:

Manual count	12 days
Directional ATC Count	0 days

This data displays the number of manual classified surveys and the number of unclassified ATC surveys, the total adding up to the overall number of surveys in the selected set. Manual surveys are undertaken using staff, whilst ATC surveys are undertaking using machines.

Selected Locations:

Edge of Town	12

This data displays the number of surveys per main location category within the selected set. The main location categories consist of Free Standing, Edge of Town, Suburban Area, Neighbourhood Centre, Edge of Town Centre, Town Centre and Not Known.

Selected Location Sub Categories:

Industrial Zone	5
Commercial Zone	3
Development Zone	1
Out of Town	1
No Sub Category	2

APPENDIX 9.5
TRICS: OFFICES

This data displays the number of surveys per location sub-category within the selected set. The location sub-categories consist of Commercial Zone, Industrial Zone, Development Zone, Residential Zone, Retail Zone, Built-Up Zone, Village, Out of Town, High Street and No Sub Category.

Secondary Filtering selection:

Use Class:

Not Known	12 days

This data displays the number of surveys per Use Class classification within the selected set. The Use Classes Order 2005 has been used for this purpose, which can be found within the Library module of TRICS®.

Filter by Site Operations Breakdown:
All Surveys Included

Population within 500m Range:
All Surveys Included

Population within 1 mile:

1,001 to 5,000	1 days
5,001 to 10,000	2 days
10,001 to 15,000	6 days
15,001 to 20,000	3 days

This data displays the number of selected surveys within stated 1-mile radii of population.

Population within 5 miles:

50,001 to 75,000	1 days
100,001 to 125,000	2 days
125,001 to 250,000	6 days
250,001 to 500,000	3 days

This data displays the number of selected surveys within stated 5-mile radii of population.

Car ownership within 5 miles:

0.6 to 1.0	6 days
1.1 to 1.5	6 days

This data displays the number of selected surveys within stated ranges of average cars owned per residential dwelling, within a radius of 5-miles of selected survey sites.

Travel Plan:

Yes	1 days
No	11 days

This data displays the number of surveys within the selected set that were undertaken at sites with Travel Plans in place, and the number of surveys that were undertaken at sites without Travel Plans.

PTAL Rating:

No PTAL Present	12 days

This data displays the number of selected surveys with PTAL Ratings.

Total Rates:			3.759			3.867			7.626

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

*To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.*

Parameter summary

Trip rate parameter range selected:	1500 - 142687 (units: sqm)
Survey date date range:	01/01/13 - 21/11/19
Number of weekdays (Monday-Friday):	12
Number of Saturdays:	0
Number of Sundays:	0
Surveys automatically removed from selection:	0
Surveys manually removed from selection:	0

This section displays a quick summary of some of the data filtering selections made by the TRICS® user. The trip rate calculation parameter range of all selected surveys is displayed first, followed by the range of minimum and maximum survey dates selected by the user. Then, the total number of selected weekdays and weekend days in the selected set of surveys are show. Finally, the number of survey days that have been manually removed from the selected set outside of the standard filtering procedure are displayed.

These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

*To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.*

Calculation Reference: AUDIT-746001-211027-1003

TRIP RATE CALCULATION SELECTION PARAMETERS:

Land Use : 06 - HOTEL, FOOD & DRINK
Category : C - PUB/RESTAURANT
TOTAL VEHICLES

Selected regions and areas:

05	EAST MIDLANDS		
	NR	NORTHAMPTONSHIRE	1 days
06	WEST MIDLANDS		
	ST	STAFFORDSHIRE	1 days
08	NORTH WEST		
	GM	GREATER MANCHESTER	1 days

This section displays the number of survey days per TRICS® sub-region in the selected set

Primary Filtering selection:

This data displays the chosen trip rate parameter and its selected range. Only sites that fall within the parameter range are included in the trip rate calculation.

Parameter: Gross floor area
Actual Range: 525 to 720 (units: sqm)
Range Selected by User: 500 to 2384 (units: sqm)

Parking Spaces Range: All Surveys Included

Public Transport Provision:
Selection by: Include all surveys

Date Range: 01/01/13 to 11/06/19

This data displays the range of survey dates selected. Only surveys that were conducted within this date range are included in the trip rate calculation.

Selected survey days:

Tuesday	1 days
Wednesday	1 days
Friday	1 days

This data displays the number of selected surveys by day of the week.

Selected survey types:

Manual count	3 days
Directional ATC Count	0 days

This data displays the number of manual classified surveys and the number of unclassified ATC surveys, the total adding up to the overall number of surveys in the selected set. Manual surveys are undertaken using staff, whilst ATC surveys are undertaking using machines.

Selected Locations:

Edge of Town	3

This data displays the number of surveys per main location category within the selected set. The main location categories consist of Free Standing, Edge of Town, Suburban Area, Neighbourhood Centre, Edge of Town Centre, Town Centre and Not Known.

Selected Location Sub Categories:

Commercial Zone	1
Residential Zone	2

This data displays the number of surveys per location sub-category within the selected set. The location sub-categories consist of Commercial Zone, Industrial Zone, Development Zone, Residential Zone, Retail Zone, Built-Up Zone, Village, Out of Town, High Street and No Sub Category.

APPENDIX 9.6
TRICS: PUB/RESTAURANT

Secondary Filtering selection:

Use Class:

Sui Generis	3 days

This data displays the number of surveys per Use Class classification within the selected set. The Use Classes Order 2005 has been used for this purpose, which can be found within the Library module of TRICS®.

Population within 500m Range:

All Surveys Included

Population within 1 mile:

1,001 to 5,000	1 days
5,001 to 10,000	1 days
25,001 to 50,000	1 days

This data displays the number of selected surveys within stated 1-mile radii of population.

Population within 5 miles:

5,001 to 25,000	1 days
125,001 to 250,000	1 days
250,001 to 500,000	1 days

This data displays the number of selected surveys within stated 5-mile radii of population.

Car ownership within 5 miles:

0.6 to 1.0	1 days
1.1 to 1.5	2 days

This data displays the number of selected surveys within stated ranges of average cars owned per residential dwelling, within a radius of 5-miles of selected survey sites.

Travel Plan:

No	3 days

This data displays the number of surveys within the selected set that were undertaken at sites with Travel Plans in place, and the number of surveys that were undertaken at sites without Travel Plans.

PTAL Rating:

No PTAL Present	3 days

This data displays the number of selected surveys with PTAL Ratings.

Total Rates:			28.872			27.910			56.782

This section displays the trip rate results based on the selected set of surveys and the selected count type (shown just above the table). It is split by three main columns, representing arrivals trips, departures trips, and total trips (arrivals plus departures). Within each of these main columns are three sub-columns. These display the number of survey days where count data is included (per time period), the average value of the selected trip rate calculation parameter (per time period), and the trip rate result (per time period). Total trip rates (the sum of the column) are also displayed at the foot of the table.

*To obtain a trip rate, the average (mean) trip rate parameter value (TRP) is first calculated for all selected survey days that have count data available for the stated time period. The average (mean) number of arrivals, departures or totals (whichever applies) is also calculated (COUNT) for all selected survey days that have count data available for the stated time period. Then, the average count is divided by the average trip rate parameter value, and multiplied by the stated calculation factor (shown just above the table and abbreviated here as FACT). So, the method is: COUNT/TRP*FACT. Trip rates are then rounded to 3 decimal places.*

Parameter summary

Trip rate parameter range selected:	525 - 720 (units: sqm)
Survey date date range:	01/01/13 - 11/06/19
Number of weekdays (Monday-Friday):	3
Number of Saturdays:	0
Number of Sundays:	0
Surveys automatically removed from selection:	0
Surveys manually removed from selection:	0

This section displays a quick summary of some of the data filtering selections made by the TRICS® user. The trip rate calculation parameter range of all selected surveys is displayed first, followed by the range of minimum and maximum survey dates selected by the user. Then, the total number of selected weekdays and weekend days in the selected set of surveys are show. Finally, the number of survey days that have been manually removed from the selected set outside of the standard filtering procedure are displayed.

Calculation Reference: AUDIT-733701-211026-1002

Primary Filtering selection:

This data displays the chosen trip rate parameter and its selected range. Only sites that fall within the parameter range are included in the trip rate calculation.

Parameter:	Gross floor area
Actual Range:	1800 to 11200 (units: sqm)
Range Selected by User:	200 to 22662 (units: sqm)

Parking Spaces Range: All Surveys Included

Public Transport Provision:
Selection by: Include all surveys

Date Range: 01/01/00 to 23/11/19

This data displays the range of survey dates selected. Only surveys that were conducted within this date range are included in the trip rate calculation.

Selected survey days:

Tuesday	1 days
Wednesday	1 days

This data displays the number of selected surveys by day of the week.

Selected survey types:

Manual count	2 days
Directional ATC Count	0 days

This data displays the number of manual classified surveys and the number of unclassified ATC surveys, the total adding up to the overall number of surveys in the selected set. Manual surveys are undertaken using staff, whilst ATC surveys are undertaking using machines.

Selected Locations:

Edge of Town	2

This data displays the number of surveys per main location category within the selected set. The main location categories consist of Free Standing, Edge of Town, Suburban Area, Neighbourhood Centre, Edge of Town Centre, Town Centre and Not Known.

Selected Location Sub Categories:

Out of Town	1
No Sub Category	1

This data displays the number of surveys per location sub-category within the selected set. The location sub-categories consist of Commercial Zone, Industrial Zone, Development Zone, Residential Zone, Retail Zone, Built-Up Zone, Village, Out of Town, High Street and No Sub Category.

Secondary Filtering selection:

Use Class:

n/a	1 days
F1(c)	1 days

This data displays the number of surveys per Use Class classification within the selected set. The Use Classes Order 2005 has been used for this purpose, which can be found within the Library module of TRICS®.

APPENDIX 9.7
TRICS: ART GALLERY/
MUSEUMS/EXHIBITIONS

Secondary Filtering selection (Cont.):

Population within 500m Range:
All Surveys Included

Population within 1 mile:

1,001 to 5,000	2 days

This data displays the number of selected surveys within stated 1-mile radii of population.

Population within 5 miles:

5,001 to 25,000	1 days
75,001 to 100,000	1 days

This data displays the number of selected surveys within stated 5-mile radii of population.

Car ownership within 5 miles:

0.5 or Less	1 days
0.6 to 1.0	1 days

This data displays the number of selected surveys within stated ranges of average cars owned per residential dwelling, within a radius of 5-miles of selected survey sites.

Travel Plan:

Not Known	1 days
No	1 days

This data displays the number of surveys within the selected set that were undertaken at sites with Travel Plans in place, and the number of surveys that were undertaken at sites without Travel Plans.

PTAL Rating:

No PTAL Present	2 days

This data displays the number of selected surveys with PTAL Ratings.

1.0 INTRODUCTION

1.1 Background to Road Safety Audit

1.1.1 As part of the Shoreham Cement Works Area Action Plan (AAP) Transport Study, ADL has commissioned at Stage 1 Road Safety Audit of the proposed site access roundabout junction.

1.1.2 The audit was undertaken in accordance with GG119 by Highway Associates and this Designer's Response has been prepared in line with the template provided at Appendix F of GG119 Design Manual for Roads and Bridges.

1.1.3 The Stage 1 Road Safety Audit is provided as Appendix A.

1.2 Key Personnel

1.2.1 The following organisations were involved in the preparation of the safety audit.

Table 1A Key Personnel

Overseeing Organisation	Amol Pisal ADL Traffic and Highways Engineering Ltd amol@adltraffic.co.uk
RSA Team	Naresh Madhavan (Team Leader) Highway Associates Robin Sawczyn Highway Associates
Design Organisation	Name - TBC West Sussex County Council

2.0 ROAD SAFETY AUDIT DECISION LOG

2.1 This section considers the matters raised in the audit, utilising the same numbering as the audit document.

Audit Reference 3.1.1

RSA Problem: LOCATION: A283 SUMMARY: Risk of excessive approach speeds Site observations indicate that current vehicular speeds along this section of the A283 within the vicinity of the proposed roundabout are relatively high. Whilst speed data has not been supplied as part of the audit brief, it is expected that 85th percentile speeds are close to the posted national speed limit with the potential for much higher speeds to be recorded which is thought to be down to the relatively straight alignment of the road in this location. Should this continue if the roundabout is installed, concern is expressed that high approach speeds could increase the risk of loss of control at the north and southbound roundabout entries.
RSA Recommendation: Ensure suitable measures are incorporated at the detailed design stage to increase the conspicuity of the roundabout, such as advanced warning and map type signage.
Design Organisation Response: It is accepted that at later planning application stage or detailed design stage, measures would be proposed and agreed with SDNPA and WSCC with regards to incorporating advanced warning and map type signage.
Overseeing Organisation Response:
Agreed RSA Action:

Audit Reference 3.1.2

RSA Problem: LOCATION: A283 SUMMARY: Risk of excessive circulating speed due to roundabout geometry Concern is expressed that due to the relative lack of deflection and multi lane approaches in the north-south directions that during less busy times, drivers may be encouraged to negotiate the roundabout at higher than desired speeds using the most direct path increasing the potential for loss of control conflict or failure to giveway type conflicts involving traffic attempting to join the circulatory carriageway from the side road arms.
RSA Recommendation: The roundabout geometry should be adjusted so that it promotes a safe distribution of circulating speeds.
Design Organisation Response: This is accepted. The geometry has been further amended as shown **RSA DR Appendix B**. This has resulted in achieving appropriate deflection.
Overseeing Organisation Response:
Agreed RSA Action:

Audit Reference 3.1.3

RSA Problem: LOCATION: A283 – Southbound exit / Proposed southbound bus stop layby SUMMARY: Risk of loss of control / conflict with buses due to alignment Notwithstanding problems 3.1.1 and 3.1.2, concern is expressed that due to the proposed alignment that there could be an increased potential for southbound traffic to cut through the proposed bus stop layby when exiting the roundabout at speed, potentially conflicting with waiting buses or striking the exit taper kerb of the layby which may result in loss of control. The situation is somewhat exacerbated by the potential for high speeds in this location.
RSA Recommendation: The bus stop layby should be relocated to a suitable position away from the roundabout exit.
Design Organisation Response: This is accepted. The southbound bus stop has been relocated further away from the roundabout.
Overseeing Organisation Response:
Agreed RSA Action:

Audit Reference 3.1.4

RSA Problem: LOCATION: Proposed roundabout SUMMARY: Risk of side swipe conflicts It is unclear as to whether the circulatory carriageway is sufficiently wide enough to allow vehicles, particularly HGVs to circulate side by side without increased risk of side swipe conflicts.
RSA Recommendation: Undertake swept path analysis to identify the exact nature of the problem. If necessary, the circulatory carriageway should be suitably widened to allow for two vehicles to simultaneously circulate.
Design Organisation Response: This is accepted. Swept path assessment as requested is provided as **RSA DR Appendix C**.
Overseeing Organisation Response:
Agreed RSA Action:

Audit Reference 3.2.1

RSA Problem:

LOCATION: Proposed roundabout

SUMMARY: Insufficient pedestrian crossing provision

Exact details of the proposed development have not been provided as part of the audit brief, however concern is expressed as to whether uncontrolled crossings are sufficient in this location in relation to likely demand. Other factors to consider are the high-speed nature of the route, multiple splitter islands which will require multi stage crossing that will potentially leave pedestrians exposed to increased danger of being struck by errant vehicles whilst waiting to cross within the splitter islands. Insufficient crossing provision could increase the risk of pedestrian to vehicular conflict.

RSA Recommendation:

A suitable pedestrian crossing assessment should be undertaken at the detailed design stage. It is noted that an existing underpass is present which is to be improved as part of the proposed works. If appropriate this should be promoted as the crossing route rather than encouraging pedestrians to cross the mainline carriageway.

Design Organisation Response:

This is accepted. The tunnel would be improved in accordance with the LTN 1/20 and would be the main pedestrian crossing route between the eastern and western part of the site and provide connection to Downs Link. Majority of the pedestrians who may choose to use the crossing points on this proposed roundabout are those who would be travelling by bus and therefore require to walk to the proposed bus layby on the A283. It should be noted that as an alternative, there could be bus stops provided on site subject to future Masterplanning. If this occurs, then the number of pedestrians using splitter islands on the roundabout would be very low.

Overseeing Organisation Response:

Agreed RSA Action:

Audit Reference 3.3.1

RSA Problem: LOCATION: A283 - Proposed roundabout approaches SUMMARY: Right turn arrows could cause driver confusion By providing right turn arrow road markings in the offside traffic lanes, that drivers, particularly those visiting from foreign countries may become confused as to the road layout, and turn right at the roundabout giveway line against the flow of traffic potentially resulting in head-on conflicts with circulating traffic.
RSA Recommendation: A review of the proposed road markings should be undertaken at the detailed design stage and a robust system of signage and road markings provided to ensure that the road layout is suitably clear to all road users.
Design Organisation Response: This is accepted. A review of the proposed road markings on the proposed roundabout would be undertaken at a later stage such as planning application stage or detailed design stage, in discussion with SDNPA and WSCC.
Overseeing Organisation Response:
Agreed RSA Action:

Audit Reference 3.6.1

RSA Problem: LOCATION: West side of A283 SUMMARY: Risk of incursion It is noted that there is a significant level difference between the A283 and existing levels to the west of the carriageway which will be made more severe by the proposed works construction. Concern is expressed that should a vehicle lose control within this location that any subsequent incursion could increase the likely casualty severity.
RSA Recommendation: A suitable risk assessment should be undertaken at the detailed design stage and mitigation implemented to protect from incursion if necessary.
Design Organisation Response: This is accepted. A suitable mitigation measure to protect vehicles from incursion. This will be discussed at a later stage such as planning application stage or detailed design stage, in discussion with SDNPA and WSCC.
Overseeing Organisation Response:
Agreed RSA Action:

2.2 This completes the review of the matters raised in the Safety Audit and demonstrates that all matters have been addressed where appropriate.

3.0 STATEMENTS

3.1 Design Organisation

3.1.1 The following declaration has been completed on behalf of the design organisation.

Design Organisation Statement

On behalf of the design organisation, I certify that: 1) The RSA actions identified in response to the road safety audit problems in this road safety audit have been discussed and agreed with Overseeing Organisation.	
Name:	Amol Pisal
Signed:	Position:	Managing Director
Organisation:	ADL Traffic and Highways Engineering Ltd
Date:	11.03.2022

3.2 Overseeing Organisation

3.2.1 The following declaration has been completed on behalf of the overseeing organisation.

Overseeing Organisation Statement

On behalf of the design organisation, I certify that: 1) The RSA actions identified in response to the road safety audit problems in this road safety audit have been discussed and agreed with the design organisation; and 2) The agreed RSA action will be progressed.

FINAL	09/03/22	N Madhavan	R Sawczyn	L Madhavan	For Issue

CONTENTS

1 INTRODUCTION

1.1 This report results from a Stage 1 Road Safety Audit carried out relating to the provision of a new 4 arm roundabout, off A283 Steyning Road, Shoreham. The audit was carried out during March 2022.

1.2 The audit team consisted of:

Team Leader: Naresh Madhavan MCIHT, MSoRSA EU RSA Cert. Comp
Director
Highway Associates

Team Member: Robin Sawczyn BEng MCIHT MSoRSA
Senior Road Safety Engineer
Highway Associates

1.3 The audit took place at the offices of Highway Associates, Chester. The Road Safety Audit was undertaken in accordance with the Road Safety Audit Brief provided by Alex Painting of ADL Traffic. The Road Safety Audit comprised an examination of the documents provided and these are listed in Appendix A.

The site was visited at the following times/conditions:

Day/Date	Time	Weather Con	Traffic Flow
Sun 6th Mar 2022	15:30 – 16:10hrs	Dry/Fine	Ave

1.4 The terms of reference for this audit are as given in GG119, Design Manual for Roads and Bridges. The scheme has been examined and this report compiled only with regard to the safety implications for road users of the scheme as presented. It has not been examined or verified for compliance with any other standards or criteria. However, in order to clearly explain a safety problem or the recommendation to resolve a problem, the Audit Team may on occasion have referred to a design standard for information only. Any audit comments should not be construed as implying that a technical audit has been undertaken in any respect.

1.5 If relevant within this report the generic term “pedestrians” can include walking pedestrians, wheelchair users, dismounted cyclists, the blind, partially sighted, mobility impaired and people

with prams or pushchairs. Highway Maintenance Operatives are also included within this term. Where a problem is specific to one or more of these vulnerable groups then appropriate reference will be made in the report.

1.6 Any recommendations included within this report should not be regarded as being prescriptive design solutions to the problems identified. They are intended only to indicate a proportionate and viable means of eliminating or mitigating the identified problem, in accordance with GG119, and in no way imply that a formal design process has been undertaken. There may be alternative methods of addressing a problem which would be equally acceptable in achieving the desired elimination or mitigation and these should be considered when responding to this report.

1.7 This Road Safety Audit makes allowance for the fact that strategic decisions on matters such as route choice, junction type, standard of provision and approved Departures from Standards already reflect an appropriate balance of a number of factors including road safety.

1.8 The Audit Team have not been made aware of any possible Departure from Standards.

1.9 The reader is reminded that a Road Safety Audit is not limited to the new works alone where there are features that are considered by the Audit Team to affect the general safety in the area. Section 3 of this report lists 'Problems' identified from the drawings and as a result of the site visit relating to the proposed changes to the highway layout that are directly, or indirectly, related to the area (e.g. features/matters within the proposed works or immediate surrounds which the Audit Team feel should be brought to the attention of the Designer or other organisations even though they might not pose an immediate risk associated with the proposed works), and which are considered by the Audit Team to warrant attention under the subject proposals, generally by the maintaining authority. On occasions there are more sensitive issues or issues that fall outside the audit brief but which are of such a nature that Auditors feel should be specifically brought to the attention of the authorities - such issues, if they arise, are usually dealt with in detail in separate correspondence.

2 ITEMS RAISED BY PREVIOUS AUDITS AND REPORTS

2.1 It is understood that no previous road safety audits have been undertaken in relation to this scheme.

3 ITEMS RAISED BY THIS AUDIT

3.1 General

3.1.1 PROBLEM

LOCATION: A283

SUMMARY: Risk of excessive approach speeds

Site observations indicate that current vehicular speeds along this section of the A283 within the vicinity of the proposed roundabout are relatively high. Whilst speed data has not been supplied as part of the audit brief, it is expected that 85th percentile speeds are close to the posted national speed limit with the potential for much higher speeds to be recorded which is thought to be down to the relatively straight alignment of the road in this location. Should this continue if the roundabout is installed, concern is expressed that high approach speeds could increase the risk of loss of control at the north and southbound roundabout entries.

RECOMMENDATION

Ensure suitable measures are incorporated at the detailed design stage to increase the conspicuity of the roundabout, such as advanced warning and map type signage.

3.1.2 PROBLEM

LOCATION: A283

SUMMARY: Risk of excessive circulating speed due to roundabout geometry

Concern is expressed that due to the relative lack of deflection and multi lane approaches in the north-south directions that during less busy times, drivers may be encouraged to negotiate the roundabout at higher than desired speeds using the most direct path increasing the potential for loss of control conflict or failure to giveway type conflicts involving traffic attempting to join the circulatory carriageway from the side road arms.

RECOMMENDATION

The roundabout geometry should be adjusted so that it promotes a safe distribution of circulating speeds.

3.1.3 PROBLEM

LOCATION: A283 – Southbound exit / Proposed southbound bus stop layby

SUMMARY: Risk of loss of control / conflict with buses due to alignment

Notwithstanding problems 3.1.1 and 3.1.2, concern is expressed that due to the proposed alignment that there could be an increased potential for southbound traffic to cut through the proposed bus stop layby when exiting the roundabout at speed, potentially conflicting with waiting buses or striking the exit taper kerb of the layby which may result in loss of control. The situation is somewhat exacerbated by the potential for high speeds in this location.

RECOMMENDATION

The bus stop layby should be relocated to a suitable position away from the roundabout exit.

3.1.4 PROBLEM

LOCATION: Proposed roundabout

SUMMARY: Risk of side swipe conflicts

It is unclear as to whether the circulatory carriageway is sufficiently wide enough to allow vehicles, particularly HGVs to circulate side by side without increased risk of side swipe conflicts.

RECOMMENDATION

Undertake swept path analysis to identify the exact nature of the problem. If necessary, the circulatory carriageway should be suitably widened to allow for two vehicles to simultaneously circulate.

3.2 Non Motorised Road User Provision

3.2.1 PROBLEM

LOCATION: Proposed roundabout

SUMMARY: Insufficient pedestrian crossing provision

Exact details of the proposed development have not been provided as part of the audit brief, however concern is expressed as to whether uncontrolled crossings are sufficient in this location in relation to likely demand. Other factors to consider are the high-speed nature of the route, multiple splitter islands which will require multi stage crossing that will potentially leave pedestrians exposed to increased danger of being struck by errant vehicles whilst waiting to cross within the splitter islands. Insufficient crossing provision could increase the risk of pedestrian to vehicular conflict.

RECOMMENDATION

A suitable pedestrian crossing assessment should be undertaken at the detailed design stage. It is noted that an existing underpass is present which is to be improved as part of the proposed works. If appropriate this should be promoted as the crossing route rather than encouraging pedestrians to cross the mainline carriageway.

3.3 Road Signs and Markings

3.3.1 PROBLEM

LOCATION: A283 - Proposed roundabout approaches

SUMMARY: Right turn arrows could cause driver confusion

By providing right turn arrow road markings in the offside traffic lanes, that drivers, particularly those visiting from foreign countries may become confused as to the road layout, and turn right at the roundabout giveway line against the flow of traffic potentially resulting in head-on conflicts with circulating traffic.

RECOMMENDATION

A review of the proposed road markings should be undertaken at the detailed design stage and a robust system of signage and road markings provided to ensure that the road layout is suitably clear to all road users.

3.4 Lighting and Signals

No comments at this stage

3.5 Landscaping

No comments at this stage

3.6 Protective Aids

3.6.1 PROBLEM

LOCATION: West side of A283

SUMMARY: Risk of incursion

It is noted that there is a significant level difference between the A283 and existing levels to the west of the carriageway which will be made more severe by the proposed works construction. Concern is expressed that should a vehicle lose control within this location that any subsequent incursion could increase the likely casualty severity.

RECOMMENDATION

A suitable risk assessment should be undertaken at the detailed design stage and mitigation implemented to protect from incursion if necessary.

3.7 Surface Characteristics and Drainage

No comments at this stage

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

D7	Scenario 4	AM	ONE HOUR	07:45	09:15	15	✓
D8	Scenario 4	PM	ONE HOUR	16:45	18:15	15	✓

Analysis Set Details

ID	Include in report	Network flow scaling factor (%)	Network capacity scaling factor (%)
A1	✓	100.000	100.000

Scenario 1, AM

Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	2 - Eastern Site Access - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	3 - A283 (South) - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	4 - Western Site Access - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs.

Junction Network

Junctions

Junction	Name	Junction Type	Arm order	Junction Delay (s)	Junction LOS
1	untitled	Standard Roundabout	1, 2, 3, 4	4.55	A

Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	35	1 - A283 (North)

Arms

Arms

Arm	Name	Description
1	A283 (North)	
2	Eastern Site Access	
3	A283 (South)	
4	Western Site Access	

Roundabout Geometry

Arm	V - Approach road half-width (m)	E - Entry width (m)	l' - Effective flare length (m)	R - Entry radius (m)	D - Inscribed circle diameter (m)	PHI - Conflict (entry) angle (deg)	Exit only
1 - A283 (North)	3.65	11.70	28.9	30.0	45.0	22.0	
2 - Eastern Site Access	3.65	7.30	33.0	30.0	45.0	22.0	
3 - A283 (South)	3.65	11.64	31.7	30.0	45.0	26.0	
4 - Western Site Access	3.65	7.63	37.0	26.0	45.0	26.0	

Slope / Intercept / Capacity

Roundabout Slope and Intercept used in model

Arm	Final slope	Final intercept (PCU/hr)
1 - A283 (North)	0.797	2501
2 - Eastern Site Access	0.701	2008
3 - A283 (South)	0.797	2520
4 - Western Site Access	0.704	2053

The slope and intercept shown above include any corrections and adjustments.

Traffic Demand

Demand Set Details

ID	Scenario name	Time Period name	Traffic profile type	Start time (HH:mm)	Finish time (HH:mm)	Time segment length (min)	Run automatically
D1	Scenario 1	AM	ONE HOUR	07:45	09:15	15	✓

Scenario 2, PM

Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	2 - Eastern Site Access - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	3 - A283 (South) - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	4 - Western Site Access - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs.

Scenario 4, AM

Data Errors and Warnings

Severity	Area	Item	Description
Warning	Geometry	2 - Eastern Site Access - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	3 - A283 (South) - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Geometry	4 - Western Site Access - Roundabout Geometry	Effective flare length is over 30m, which is outside the normal range. Treat capacities with increasing caution.
Warning	Vehicle Mix		HV% is zero for all movements / time segments. Vehicle Mix matrix should be completed whether working in PCUs or Vehs.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

NOTES

1. PRELIMINARY DESIGN PROVIDED FOR ILLUSTRATIVE PURPOSES ONLY. ALL DETAILS ARE SUBJECT TO INCLUDING CHECKING STATATORY SERVICE APPARATUS.
2. DO NOT SCALE FROM THIS DRAWING.
3. BACKGROUND PLAN IS BASED UPON A DIGITAL OSBASE.
4. ALL DETAILS TO BE CONFIRMED ON SITE AND ON A TOPOGRAPHICAL SURVEY.
5. ALL TRACKS ASSUME GRADIENTS AND CAMBERS DO NOT EXCEED 1:60 AND 1:40 RESPECTIVELY OTHERWISE VEHICLE MANOEUVRABILITY MAY BE AFFECTED.
6. ALL LAND OWNERSHIP DETAILS, EXTENT OF ADOPTED HIGHWAY AND RIGHTS OF WAY TO BE CONFIRMED.
7. ASSUMES ALL LANDSCAPING CAN BE ALTERED AND NO TREES ARE SUBJECT TO TPO.

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

NOTES

1. PRELIMINARY DESIGN PROVIDED FOR ILLUSTRATIVE PURPOSES ONLY. ALL DETAILS ARE SUBJECT TO INCLUDING CHECKING STATATORY SERVICE APPARATUS.
2. DO NOT SCALE FROM THIS DRAWING.
3. BACKGROUND PLAN IS BASED UPON A DIGITAL OSBASE.
4. ALL DETAILS TO BE CONFIRMED ON SITE AND ON A TOPOGRAPHICAL SURVEY.
5. ALL TRACKS ASSUME GRADIENTS AND CAMBERS DO NOT EXCEED 1:60 AND 1:40 RESPECTIVELY OTHERWISE VEHICLE MANOEUVRABILITY MAY BE AFFECTED.
6. ALL LAND OWNERSHIP DETAILS, EXTENT OF ADOPTED HIGHWAY AND RIGHTS OF WAY TO BE CONFIRMED.
7. ASSUMES ALL LANDSCAPING CAN BE ALTERED AND NO TREES ARE SUBJECT TO TPO.

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

Junction Network

Junctions

Junction	Name	Junction Type	Major road direction	Junction Delay (s)	Junction LOS
1	untitled	T-Junction	Two-way	1.33	A

Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	37	Stream C-AB

Arms

Arms

Arm	Name	Description	Arm type
A	A283 (West)		Major
B	B2135		Minor
C	A283 (East)		Major

Major Arm Geometry

Arm	Width of carriageway (m)	Has kerbed central reserve	Has right turn bay	Width for right turn (m)	Visibility for right turn (m)	Blocks?	Blocking queue (PCU)
C - A283 (East)	8.30		✓	3.20	100.0	✓	9.00

Geometries for Arm C are measured opposite Arm B. Geometries for Arm A (if relevant) are measured opposite Arm D.

Minor Arm Geometry

Arm	Minor arm type	Width at give-way (m)	Width at 5m (m)	Width at 10m (m)	Width at 15m (m)	Width at 20m (m)	Estimate flare length	Flare length (PCU)	Visibility to left (m)	Visibility to right (m)
B - B2135	One lane plus flare	10.00	7.20	5.20	4.00	3.90	✓	2.00	124	214

Slope / Intercept / Capacity

Priority Intersection Slopes and Intercepts

Junction	Stream	Intercept (Veh/hr)	Slope for A-B	Slope for A-C	Slope for C-A	Slope for C-B
1	B-A	595	0.097	0.246	0.155	0.352
1	B-C	879	0.121	0.306	-	-
1	C-B	701	0.244	0.244	-	-

The slopes and intercepts shown above do NOT include any corrections or adjustments.

Streams may be combined, in which case capacity will be adjusted.

Values are shown for the first time segment only; they may differ for subsequent time segments.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

Junction Network

Junctions

Junction	Name	Junction Type	Major road direction	Junction Delay (s)	Junction LOS
1	untitled	T-Junction	Two-way	2.07	A

Junction Network Options

Driving side	Lighting	Network residual capacity (%)	First arm reaching threshold
Left	Normal/unknown	19	Stream C-AB

Arms

Arms

Arm	Name	Description	Arm type
A	untitled		Major
B	untitled		Minor
C	untitled		Major

Major Arm Geometry

Arm	Width of carriageway (m)	Has kerbed central reserve	Has right turn bay	Width for right turn (m)	Visibility for right turn (m)	Blocks?	Blocking queue (PCU)
C	8.50		✓	3.40	100.0	✓	12.00

Geometries for Arm C are measured opposite Arm B. Geometries for Arm A (if relevant) are measured opposite Arm D.

Minor Arm Geometry

Arm	Minor arm type	Width at give-way (m)	Width at 5m (m)	Width at 10m (m)	Width at 15m (m)	Width at 20m (m)	Estimate flare length	Flare length (PCU)	Visibility to left (m)	Visibility to right (m)
B	One lane plus flare	10.00	10.00	6.90	4.60	3.90	✓	2.00	73	36

Slope / Intercept / Capacity

Priority Intersection Slopes and Intercepts

Junction	Stream	Intercept (Veh/hr)	Slope for A-B	Slope for A-C	Slope for C-A	Slope for C-B
1	B-A	518	0.084	0.212	0.134	0.304
1	B-C	757	0.103	0.261	-	-
1	C-B	714	0.247	0.247	-	-

The slopes and intercepts shown above do NOT include any corrections or adjustments.

Streams may be combined, in which case capacity will be adjusted.

Values are shown for the first time segment only; they may differ for subsequent time segments.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

2. DO NOT SCALE FROM THIS DRAWING.
3. BACKGROUND PLAN IS BASED UPON A DIGITAL OSBASE.
4. ALL DETAILS TO BE CONFIRMED ON SITE AND ON A TOPOGRAPHICAL SURVEY.
5. ALL TRACKS ASSUME GRADIENTS AND CAMBERS DO NOT EXCEED 1:60 AND 1:40 RESPECTIVELY OTHERWISE VEHICLE MANOEUVRABILITY MAY BE AFFECTED.
6. ALL LAND OWNERSHIP DETAILS, EXTENT OF ADOPTED HIGHWAY AND RIGHTS OF WAY TO BE CONFIRMED.
7. ASSUMES ALL LANDSCAPING CAN BE ALTERED AND NO TREES ARE SUBJECT TO TPO.

6 - The Street	0.5	8.32	0.34	A				0.5	7.42	0.34	A			

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

Scenario 4 Total														
1 - A2037	4.5	21.31	0.83	C	24.34	C	-1 % [3 - A283 North]	3.8	17.07	0.80	C	18.35	C	3 % [2 - A283 South]
2 - A283 South	5.3	13.15	0.85	B				10.3	23.37	0.92	C			
3 - A283 North	14.0	37.87	0.95	E				4.3	12.61	0.82	B			

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

NOTES

1. PRELIMINARY DESIGN PROVIDED FOR ILLUSTRATIVE PURPOSES ONLY. ALL DETAILS ARE SUBJECT TO INCLUDING CHECKING STATATORY SERVICE APPARATUS.
2. DO NOT SCALE FROM THIS DRAWING.
3. BACKGROUND PLAN IS BASED UPON A DIGITAL OSBASE.
4. ALL DETAILS TO BE CONFIRMED ON SITE AND ON A TOPOGRAPHICAL SURVEY.
5. ALL TRACKS ASSUME GRADIENTS AND CAMBERS DO NOT EXCEED 1:60 AND 1:40 RESPECTIVELY OTHERWISE VEHICLE MANOEUVRABILITY MAY BE AFFECTED.
6. ALL LAND OWNERSHIP DETAILS, EXTENT OF ADOPTED HIGHWAY AND RIGHTS OF WAY TO BE CONFIRMED.
7. ASSUMES ALL LANDSCAPING CAN BE ALTERED AND NO TREES ARE SUBJECT TO TPO.

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

A27 (SE)	Arm 3 (11.3)				13.3	Yes	Max 13.56
A283 (SW)	Arm 4 (12.5)				13.7	Yes	Max 13.8
Central island diameter		I	3.7	I value ≤4m	100.4	Yes	
Central overrun area		b	3.8 to 3.9	To provide sufficient entry deflection for vehicles while still allowing large vehicles to circulate	N/A	N/A	No central overrun area is provided on either inside or outside as existing.
Splitter island width	Arm 1	s	8.0 onwards	s value absolute minimum 1.2m, preferably 2.5m	30.9	Yes	Measured at widest point
	Arm 2				19.8	Yes	Measured at widest point
	Arm 3				47.1	Yes	Measured at widest point
	Arm 4				19.0	Yes	Measured at widest point
Entry width	Arm 1	e	3.13	e value 15m parameter range (practical limits for dual carriageway approach)	11.6	Yes	
	Arm 2				14.3	Yes	
	Arm 3				11.3	Yes	
	Arm 4				12.0	Yes	
Approach half width	Arm 1	v	3.16 and Table B.2		4.9	Yes	No change from existing
	Arm 2			v value 2.0m - 7.3m parameter range (practical limits)	8.2	Yes	No change from existing
	Arm 3				6.8	Yes	No change from existing
	Arm 4				4.0	Yes	No change from existing
Entry lane alignment	Arm 1	L	3.18	Splitter island kerb (arc) must be tangential to central island when extended forward from give way line		Yes	Curve is tangential
	Arm 2					Yes	Curve is tangential
	Arm 3					Yes	Curve is tangential
	Arm 4					Yes	Curve is tangential
Flare length	Arm 1	l'	3.17		24.9	Yes	
	Arm 2			single lane entries should be slightly flared to accommodate HGV's	19.8	Yes	
	Arm 3				32.5	Yes	
	Arm 4				26.4	Yes	
Entry angle	Arm 1	Φ	3.18		31.0	Yes	
	Arm 2			Φ value between 20 to 60 degrees	32.0	Yes	
	Arm 3				38.0	Yes	
	Arm 4				48.0	Yes	
Entry kerb radius	Arm 1	r	3.19		81.0	Yes	
	Arm 2			r value between 10m to 100m	29.2	Yes	
	Arm 3				46.9	Yes	
	Arm 4				32.1	Yes	
Entry path radius	Arm 1	length of a(ent)	3.20 to 3.26		83.8	Yes	
	Arm 2			a value ≤ 100m for 25m length	64.4	Yes	
	Arm 3				64.7	Yes	
	Arm 4				88.3	Yes	
Exit width	Arm 1	ew	3.28		7.4	Yes	
	Arm 2			ew values similar to entry width	6.2	Yes	
	Arm 3				6.7	Yes	
	Arm 4				7.1	Yes	
Exit kerb radius	Arm 1	a(exit)	3.29		72.7	Yes	
	Arm 2			a values between 15m to 100m	71.5	Yes	
	Arm 3				N/A	N/A	As per the existing situation.
	Arm 4				68.5	Yes	
Visibility on Approach	Arm 1	va	3.37		94.0	Yes	In accordance with Annex B of "**Design & Maintenance Guidance for Local Authority Roads - Provision of Road Restraint Systems on Local Authority Roads**", the curve design speeds on these approaches are such that the forward visibility requirements are lower than the achieved. As discussed, appropriate visibility screening measures Could be installed following further discussions with WSCC, National Highways and SDNPA.
	Arm 2			To be in accordance with CD109	96.0	Yes	
	Arm 3				69.4	Yes	
	Arm 4				215.0	Yes	
Visibility on Entry	Arm 1	ve	3.43		70.0	Yes	Assume no construction on central island
	Arm 2			Visibility distance of 40m for ICD 40m to 60m rounabouts	70.0	Yes	Assume no construction on central island
	Arm 3				70.0	Yes	Assume no construction on central island
	Arm 4				70.0	Yes	Assume no construction on central island

	a - longitudinal gradient	0	0	0	0	*Assumed to be 0*
	SSD requirement	32.756367	46.893557	68.70387259	53.770674	*SSD = vt + v^2/(2(d+0.1a))*
	SSD (rounded)	33	47	69	54	*Rounded*

Annex B (Extract)

The Curve design speed can be calculated from the road standards using the following formula:

$$V_{design} = \sqrt{127.R.(e+f)}$$

R = curve radius in metres
e = super-elevation or crossfall in metres per metre
f = side friction factor
and the resultant V_{design} is in km/h.

Several studies aimed at determining the maximum side-friction factors (f) that are comfortable for drivers have been conducted. Some of the results from these studies (AASHTO, 1994) are tabulated below and these results can be used to select the appropriate f value to calculate the Curve design speed.

SPEED (KM/H)	COMFORTABLE SIDE-FRICTION FACTOR
40	0.21
50	0.18
55-80	0.15
> 110	0.10

The side-friction factors that are employed in the design of horizontal curves should accommodate the safety and comfort of the intended users.[18]. The side-friction factor is associated to the SCRIM value at a particular site

MfS 2 - SSD Formula

10.1.5 The basic formula for calculating SSD (in metres) is:

$SSD = vt + v^2/2(d+0.1a)$

where:
v = speed (m/s)
t = driver perception-reaction time (seconds)
d = deceleration (m/s^2)
a = longitudinal gradient (%)
(+ for upgrades and - for downgrades)

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

NOTES

1. PRELIMINARY DESIGN PROVIDED FOR ILLUSTRATIVE PURPOSES ONLY. ALL DETAILS ARE SUBJECT TO INCLUDING CHECKING STATATORY SERVICE APPARATUS.
2. DO NOT SCALE FROM THIS DRAWING.
3. BACKGROUND PLAN IS BASED UPON A DIGITAL OSBASE.
4. ALL DETAILS TO BE CONFIRMED ON SITE AND ON A TOPOGRAPHICAL SURVEY.
5. ALL TRACKS ASSUME GRADIENTS AND CAMBERS DO NOT EXCEED 1:60 AND 1:40 RESPECTIVELY OTHERWISE VEHICLE MANOEUVRABILITY MAY BE AFFECTED.
6. ALL LAND OWNERSHIP DETAILS, EXTENT OF ADOPTED HIGHWAY AND RIGHTS OF WAY TO BE CONFIRMED.
7. ASSUMES ALL LANDSCAPING CAN BE ALTERED AND NO TREES ARE SUBJECT TO TPO.

Scenario 4 Total														
1 - Upper Shoreham Road	8.5	39.68	0.91	E	71.04	F	-14 % [3 - A283 North]	12.3	56.43	0.95	F	412.09	F	-33 % [3 - A283 North]
2 - A283 South	4.2	23.79	0.82	C				3.4	18.85	0.78	C			
3 - A283 North	35.2	136.33	1.05	F				223.2	899.77	1.40	F			

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

Data Errors and Warnings

Severity	Area	Item	Description
Warning	Mini-roundabout		Mini-roundabout appears to have unbalanced flows and may behave like a priority junction; treat results with caution. See User Guide for details.[Arms 1 and 2 have 81% of the total flow for the roundabout for one or more time segments]

Data Errors and Warnings

Severity	Area	Item	Description
Warning	Mini-roundabout		Mini-roundabout appears to have unbalanced flows and may behave like a priority junction; treat results with caution. See User Guide for details.[Arms 1 and 2 have 81% of the total flow for the roundabout for one or more time segments]

3 - A283	0.9	5.82	0.48	A				1.9	8.26	0.66	A			

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

APPENDIX 21.3
ARCADY OUTPUTS: PROPOSED DEVELOPMENT SCENARIOS
(WITH PROPOSED JUNCTION IMPROVEMENTS)

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

NOTES

1. PRELIMINARY DESIGN PROVIDED FOR ILLUSTRATIVE PURPOSES ONLY. ALL DETAILS ARE SUBJECT TO INCLUDING CHECKING STATATORY SERVICE APPARATUS.
2. DO NOT SCALE FROM THIS DRAWING.
3. BACKGROUND PLAN IS BASED UPON A DIGITAL OSBASE.
4. ALL DETAILS TO BE CONFIRMED ON SITE AND ON A TOPOGRAPHICAL SURVEY.
5. ALL TRACKS ASSUME GRADIENTS AND CAMBERS DO NOT EXCEED 1:60 AND 1:40 RESPECTIVELY OTHERWISE VEHICLE MANOEUVRABILITY MAY BE AFFECTED.
6. ALL LAND OWNERSHIP DETAILS, EXTENT OF ADOPTED HIGHWAY AND RIGHTS OF WAY TO BE CONFIRMED.
7. ASSUMES ALL LANDSCAPING CAN BE ALTERED AND NO TREES ARE SUBJECT TO TPO.

There are warnings associated with one or more model runs - see the 'Data Errors and Warnings' tables for each Analysis or Demand Set.

Values shown are the highest values encountered over all time segments. Delay is the maximum value of average delay per arriving vehicle. Junction LOS and Junction Delay are demand-weighted averages. Network Residual Capacity indicates the amount by which network flow could be increased before a user-definable threshold (see Analysis Options) is met.

Parameter		Variable	Paragraph	CD116 Requirement	Design Actual	Acceptable	Comments
ICD		D	3.1 to 3.5	D value between 28m and 100m	60.0	Yes	
Circulatory width		c	3.6 to 3.9	c value ≤15m		Yes	
Manor Road	Arm 1 (entry width)	e	3.6 to 3.9		9.0	Yes	Max 9.6
A27 (E)	Arm 2 (entry width)			Between 1.0 and 1.2 times entry	12.3	Yes	Max 15.36
Grinstead Lane	Arm 3 (entry width)			width, excluding any overrun area	12.0	Yes	Max 13.92
A27 (W)	Arm 4 (entry width)				12.0	Yes	Max 15.36
Central island diameter		I	3.7	I value ≤4m	39.5	Yes	Largest dimension
Central overrun area		b	3.8 to 3.9	To provide sufficient entry deflection for vehicles while still allowing large vehicles to circulate	N/A	N/A	No central overrun area provided, as per existing situation
Splitter island width	Arm 1	s	8.0 onwards		8.9	Yes	Measured at widest point
	Arm 2			s value absolute minimum 1.2m,	7.8	Yes	Measured at widest point
	Arm 3			preferably 2.5m	7.9	Yes	Measured at widest point
	Arm 4				5.6	Yes	Measured at widest point
Entry width	Arm 1	e	3.11 to 3.15	e value 4.0m - 10.5m parameter range	8.0	Yes	
	Arm 2			(practical limits for single carriageway	12.8	Yes	Dual Lane approach maximum is 15m
	Arm 3			approach)	11.6	No	However, permitted roundabout design (NMF) has 11.2m
	Arm 4				12.8	Yes	Dual Lane approach maximum is 15m
Approach half width	Arm 1	v	3.16 and Table B.2		5.4	Yes	
	Arm 2			v value 2.0m - 7.3m parameter range	7.3	Yes	
	Arm 3			(practical limits)	5.5	Yes	
	Arm 4				5.0	Yes	
Entry lane alignment	Arm 1	L	3.18	Splitter island kerb (arc) must be		Yes	Curve is tangential
	Arm 2			tangential to central island when		Yes	Curve is tangential
	Arm 3			extended forward from give way line		Yes	Curve is tangential
	Arm 4					Yes	Curve is tangential
Flare length	Arm 1	l'	3.17		22.4	Yes	
	Arm 2			single lane entries should be slightly	22.3	Yes	
	Arm 3			flared to accommodate HGV's	15.0	Yes	
	Arm 4				16.4	Yes	
Entry angle	Arm 1	Φ	3.18		46.0	Yes	
	Arm 2			Φ value between 20 to 60 degrees	34.0	Yes	
	Arm 3				44.0	Yes	
	Arm 4				51.0	Yes	
Entry kerb radius	Arm 1	r	3.19		25.0	Yes	
	Arm 2			r value between 10m to 100m	25.0	Yes	
	Arm 3				20.0	Yes	
	Arm 4				40.0	Yes	
Entry path radius	Arm 1	length of a(ent)	3.20 to 3.26		79.0	Yes	
	Arm 2			a value ≤ 100m for 25m length	85.4	Yes	
	Arm 3				98.5	Yes	Permitted roundabout design (NMF) has this value over 100m
	Arm 4				52.2	Yes	
Exit width	Arm 1	ew	3.28		7.5	Yes	
	Arm 2			ew values similar to entry width	8.0	Yes	
	Arm 3				6.5	Yes	
	Arm 4				7.2	Yes	
Exit kerb radius	Arm 1	a(exit)	3.29		12.5	Yes	Same as Permitted roundabout design (NMF)
	Arm 2			a values between 15m to 100m	61.3	Yes	
	Arm 3				61.4	Yes	
	Arm 4				20.0	Yes	
Visibility on Approach	Arm 1	va	3.37		90.0	Yes	In accordance with Annex B of "Design & Maintenance Guidance for Local Authority Roads - Provision of Road Restraint Systems on Local Authority Roads", the curve design speeds on these approaches are such that the forward visibility requirements are lower than the achieved. As discussed, appropriate visibility screening measures could be installed following further discussions with WSCC and National Highways.
	Arm 2			To be in accordance with CD109	120.0	Yes	
	Arm 3				120.0	Yes	
	Arm 4				79.8	Yes	
Visibility on Entry	Arm 1	ve	3.43		50.0	Yes	Assume no construction on central island
	Arm 2			Visibility distance of 40m for ICD 40m	50.0	Yes	Assume no construction on central island
	Arm 3			to 60m rounabouts	50.0	Yes	Assume no construction on central island
	Arm 4				50.0	Yes	Assume no construction on central island

For SSD Calcs	**v - Speed of vehicle (m/s)**	9.1534068	5.4220103	5.422010253	7.6678804	*Vdesign (km/h) x 0.621371*
	t - driver perception-reaction time (m/s)	2	2	2	2	*(MfS 2)*
	d - deceleration rate (m/s)	2.4525	2.4525	2.4525	2.4525	*0.25 x 9.81 (MfS 2)*
	a - longitudinal gradient	0	0	0	0	*Assumed to be 0*
	SSD requirement	35.388334	46.893557	46.89355735	87.434835	*SSD = vt + v^2/(2(d+0.1a))*
	SSD (rounded)	35	47	47	87	*Rounded*

Annex B (Extract)

The Curve design speed can be calculated from the road standards using the following formula:

$$V_{design} = \sqrt{127.R.(e+f)}$$

R = curve radius in metres
e = super-elevation or crossfall in metres per metre
f = side friction factor
and the resultant V_{design} is in km/h.

Several studies aimed at determining the maximum side-friction factors (f) that are comfortable for drivers have been conducted. Some of the results from these studies (AASHTO, 1994) are tabulated below and these results can be used to select the appropriate f value to calculate the Curve design speed.

SPEED (KM/H)	COMFORTABLE SIDE-FRICTION FACTOR
40	0.21
50	0.18
55-80	0.15
> 110	0.10

The side-friction factors that are employed in the design of horizontal curves should accommodate the safety and comfort of the intended users.[18]. The side-friction factor is associated to the SCRIM value at a particular site

MfS 2 - SSD Formula

10.1.5 The basic formula for calculating SSD (in metres) is:

$SSD = vt + v^2/2(d+0.1a)$
where:
v = speed (m/s)
t = driver perception-reaction time (seconds)
d = deceleration (m/s^2)
a = longitudinal gradient (%)
(+ for upgrades and - for downgrades)
