Micro Drainage Output

Drawing No. C795/3 - Overland Flowpath

1. INTRODUCTION

- 1.1. This Flood Risk Assessment has been prepared on behalf of the Clients in connection with proposals for a Development of 37 residential dwellings (including affordable homes), alterations to existing access onto Petersfield Road, hard and soft landscaping, drainage and all other associated development works on land at Liss Forest Nursery, Petersfield Road in Greatham, Liss.
- 1.2. The overall site comprises around 2.4 hectares and is located to the South East of Petersfield Road and to the South West of Bakers Field, which lies in the district of South Downs National Park. The postcode is GU33 6EU, and the approximate grid reference for the site is X: 477680, Y: 130730. The location of the site is shown edged red on Figure 1 below.

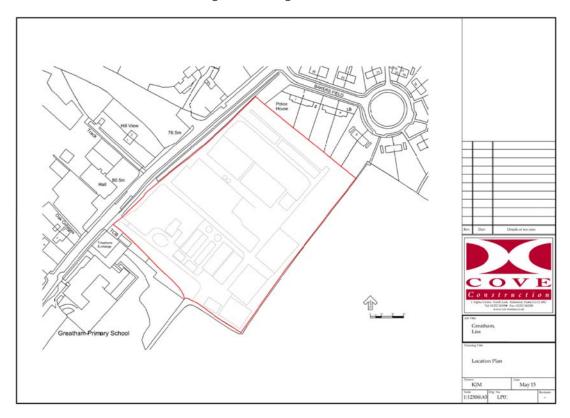

Figure 1: Site Location Plan

- 1.3. The Site is allocated for development in the South Downs local Plan: Adopted July 2019 as "Allocation Policy SD71: Land at Petersfield Road, Greatham".
- 1.4. The main purpose of this site-specific Flood Risk Assessment is to provide sufficient flood risk information to support a planning application for the development proposals in order to demonstrate that the development would be appropriately safe for its lifetime taking account of the vulnerability of its users, without increasing flood risk elsewhere, and, where possible, would reduce flood risk overall.

2. SCOPE OF THE ASSESSMENT

- 2.1. The National Planning Policy Framework (NPPF) sets out the Government's planning policies for England and how these should be applied. It was published in February 2019 and replaces the first Framework published in March 2012, and includes minor clarifications to the revised version published in July 2018.
- 2.2. Policy on planning and flood risk in the NPPF is dealt with at paragraphs 155-165 in chapter 14 'Meeting the challenge of climate change, flooding and coastal change'.
- 2.3. The national planning practice guidance to the NPPF was launched as a web-based resource in March 2014. The category dealing with flooding is contained in Flood Risk and Coastal Change (Reference ID: 7 Updated: 16 11 2016).
- 2.4. Paragraph 155 of the NPPF states that inappropriate development in areas at risk of flooding should be avoided by directing development away from areas at highest risk, but where development is necessary, making it safe without increasing flood risk elsewhere.
- 2.5. Paragraph 156 states that strategic policies should be informed by a strategic flood risk assessment (SFRA), and should manage flood risk from all sources.
- 2.6. A Level 1 SFRA was prepared by Amec Foster Wheeler on behalf of South Downs National Park Authority, in April 2015. As a result of changes to the sites within the Strategic Housing Land Availability Assessment, the proposed housing allocations in the emerging Local Plan were revised. An update to the Level 1 SFRA and a more detailed Level 2 SFRA were published in September 2017 to take account of these changes. The SFRAs provide an overview of flood risk from all sources including from rivers and the sea, directly from rainfall on the ground surface and rising groundwater, overwhelmed sewers and drainage systems, and from reservoirs, canals and lakes and other artificial sources.
- 2.7. As set out in paragraph 157 of the NPPF, all plans should apply a sequential, risk-based approach to the location of development taking into account the current and future impacts of climate change so as to avoid, where possible, flood risk to people and property.
- 2.8. Paragraph 158 states that the aim of the sequential test is to steer new development to areas with the lowest probability of flooding, and the strategic flood risk assessment will provide the basis for applying the test.
- 2.9. Paragraph 19 in the Flood Risk and Coastal Change Planning Practice Guidance¹ states that the flood zones, as refined in the SFRA for the area, provide the basis for applying the sequential test.
- 2.10. A copy of the Environment Agency's Flood Map for Planning, obtained from the GOV.UK website, which shows the Flood Zones in the vicinity of the site, is reproduced as **Figure 2** below.

¹ Planning Practice Guidance reference ID: 7-019-20140306

Download report

Your proposed development is in an area with a low probability of flooding FLOOD ZONE 1 Land and property in flood zone I have a low probability of flooding More information about flood zones You don't need to do a flood risk assessment if your development is in flood zone 1 and: eas benefit from flood · smaller than one hectare · is not affected by sources of flooding other Flood zone 2 than rivers and the sea, for example surface water drains If your development is in flood zone 1 and: · larger than one hectare · is affected by sources of flooding other than rivers and the sea, for example lood storage surface water drains you can learn more about flood risk assessment in flood zone 1 You can also read more about flood risk assessments for planning applications

Figure 2: EA Flood Map for Planning

Learn more about the potential sources of flood risk in

Flood probability

- 2.11. The Environment Agency's Flood Zones refer to the probability of river and sea flooding, ignoring the presence of defences, and show the extent of the natural floodplain and the additional extent of an extreme flood. The Environment Agency's Flood Map for Planning shows the area that could be affected by flooding, either from rivers or the sea, coloured dark blue corresponding to Flood Zone 3. The light blue area is Flood Zone 2 and shows the additional extent of an extreme flood from rivers or the sea. These two colours show the extent of the natural floodplain if there were no flood defences or certain other manmade structures and channel improvements. Where there is no blue shading, this shows the area where flooding from rivers and the sea is very unlikely corresponding to Flood Zone 1.
- 2.12. The red line site boundary has been added to the Environment Agency's Flood Map for Planning as shown in Figure 2. From an inspection of the Flood Map, it can be seen that the site falls entirely within Flood Zone 1.
- 2.13. As set out in paragraph 163 of the NPPF, when determining any planning applications, local planning authorities should ensure that flood risk is not increased elsewhere. Where appropriate, applications should be supported by a site-specific flood risk assessment.
- 2.14. Footnote 50 in the NPPF states that a site-specific flood risk assessment should be provided for all development in Flood Zones 2 and 3. In Flood Zone 1, an assessment should accompany all proposals involving: sites of 1 hectare or more; land which has been identified by the Environment Agency as having critical drainage problems; land identified in a strategic flood risk assessment as being at increased flood risk in future; or land that may be subject to other sources of flooding, where its development would introduce a more vulnerable use.

Flood Risk Assessment Guidance

- 2.15. Paragraph 30 in the Flood Risk and Coastal Change Planning Practice Guidance (Reference ID: 7-030-20140306) advises that a site-specific flood risk assessment is carried out to assess the flood risk to and from a development site. The assessment should demonstrate how flood risk will be managed now and over the development's lifetime, taking climate change into account, and with regard to the vulnerability of its users.
- 2.16. For the purposes of applying the NPPF, paragraph 2 in the Flood Risk and Coastal Change Planning Practice Guidance (Reference ID: 7-002-20140306) advises that "flood risk" is a combination of the probability and the potential consequences of flooding from all sources including from rivers and the sea, directly from rainfall on the ground surface and rising groundwater, overwhelmed sewers and drainage systems, and from reservoirs, canals and lakes and other artificial sources.
- 2.17. Paragraph 31 in the Flood Risk and Coastal Change Planning Practice Guidance (Reference ID: 7-031-20140306) advises that the information provided in the flood risk assessment should be credible and fit for purpose. Site-specific flood risk assessments should always be proportionate to the degree of flood risk and make optimum use of information already available, including information in a SFRA for the area, and the interactive flood risk maps. A flood risk assessment should also be appropriate to the scale, nature and location of development.
- 2.18. Paragraph 68 of the Flood Risk and Coastal Change Planning Practice Guidance (Reference ID: 7-068-20161116) provides a model checklist for a site specific flood risk assessment.
- 2.19. With regard to what further advice is available on the preparation of a site-specific flood risk assessment, paragraph 32 of the Flood Risk and Coastal Change Planning Practice Guidance (Reference ID: 7-032-20150415) refers to the Environment Agency Standing Advice on flood risk.
- 2.20. Guidance from the Environment Agency and Department for Environment, Food & Rural Affairs (DEFRA), on the Government's GOV.UK website includes guidance on how to carry out a flood risk assessment entitled: 'Flood risk assessment in flood zone 1 and critical drainage areas'. This guidance provides information on the range of factors that need to be considered when assessing flood risk. A copy of this guidance is reproduced in Appendix 1.
- 2.21. Reference has also been made to: BS 8533:2017 'Assessing and managing flood risk in development Code of practice'; BS 8582:2013 'Code of practice for surface water management for development sites'; and the Local Authority SuDS Officer Organisation (LASOO) document entitled 'Non-Statutory Technical Standards for Sustainable Drainage: Practice Guidance'.
- 2.22. The DEFRA/EA guidance 'Review individual flood risk assessments: standing advice for local planning authorities' sets out when local planning authorities must consult the Environment Agency, their lead local flood authority or both, on any proposed developments at a higher risk from flooding before making a decision.
- 2.23. In this context 'major development' is defined in the NPPF Annex 2: Glossary as follows: For housing, development where 10 or more homes will be provided, or the site has an area of 0.5 hectares or more.
- 2.24. For 'major development' with surface water drainage in Flood Zone 1 the local planning authority needs to consult their lead local flood authority, and if the development is in an area with critical drainage problems, they also need to consult the Environment Agency.

- 2.25. Local planning authorities also need to consult the Environment Agency if the development is within 20m of a main river in Flood Zones 1, 2 or 3.
- 2.26. The proposed development is classed as 'major development' as it is for more than 10 dwellings. The local planning authority, therefore, needs to consult their lead local flood authority. However, it is not in an area with critical drainage problems and is not within 20m of a main river, so they do not need to consult the Environment Agency.

Local Plan Policies

- 2.27. The South Downs Local Plan: Adopted July 2019 provides a planning policy framework for the period up to 2033.
- 2.28. Relevant policies from the Adopted Local Plan include Strategic Policies SD17 and SD49.
- 2.29. Strategic Policy SD49: Flood Risk Management states:

"Development proposals will be permitted that seek to reduce the impact and extent of all types of flooding through:

- a. Steering development away from areas of flood risk as identified by the Environment Agency and the Strategic Flood Risk Assessment. Development in areas of flood risk will, where relevant, be required to meet the national Sequential and Exception tests;
- b. Not increasing the risk of flooding elsewhere and, wherever possible, reducing overall flood risk;
- c. Flood protection, mitigation and adaptation measures necessary and appropriate to the specific requirements of the proposal, the development site and other areas potentially impacted; and
- d. Ensuring that the integrity of coastal and river flood defences are not undermined."

Summary of Scope

2.30. The scope of this Flood Risk Assessment is to provide sufficient information to satisfy the requirements of the NPPF, the planning practice guidance checklist, Local Plan Policies, guidance published by DEFRA/Environment Agency and the Government's 'Non-statutory technical standards for sustainable drainage systems'.

3. FLOOD RISK ASSESSMENT

Development Site and Location

- 3.1. The site is located to the south-east of Petersfield Road and south west of Bakers Field in Greatham, near Liss in the district of East Hampshire. The postcode is GU33 6HA, and the approximate grid reference for the site is X: 477675, Y: 130729.
- 3.2. The Site Location Plan and the Environment Agency's Flood Map for Planning are based on the Ordnance Survey map of the area, and show geographical features and identify watercourses and other bodies of water in the vicinity of the site.
- 3.3. The site is currently in use as a horticultural nursery and also includes a residential bungalow.
- 3.4. The nearest watercourse is an ordinary watercourse, located approximately 200m to the east of the site. The ordinary watercourse flows to the south before forming a confluence with the River Rother approximately 1km to the south of the site.

Development Proposals

- 3.5. The Development of 37 dwellings (including affordable homes), alterations to existing access onto Petersfield Road, hard and soft landscaping, drainage and all other associated development works and with associated infrastructure on land at Liss Forest Nursery, Petersfield Road in Greatham, Liss.
- 3.6. A copy of the Site Layout (37 Units) Planning Layout, Drawing Number 150715/SL37/01 Revision Z6, prepared by Carlton design partnership, showing the development proposals, is reproduced in **Appendix 2**.

Site Levels

- 3.7. A Topographical Survey was undertaken by Encompass Surveys in August 2017. A copy of Drawing Number ENC/070817/5Z3-Topo is reproduced in **Appendix 3**.
- 3.8. The Topographical Survey indicates that the site falls downhill from north-west to south-east, from around 82.8m AOD in the north-west of the site, to around 77.1m AOD in the east of the site.

Flood Risk Vulnerability and Flood Zone 'Compatibility'

- 3.9. Paragraphs 65-67 of the Flood Risk and Coastal Change Planning Practice Guidance (Reference ID: 7-065-20140306) refer to 3 Flood Zone and Flood Risk Tables.
- 3.10. Table 1: Flood Zones provides a definition of each Flood Zone. Table 2: Flood Risk Vulnerability Classification categorises different types of development according to their vulnerability to flood risk. Table 3: Flood risk vulnerability and flood zone 'compatibility' maps these vulnerability classes against the flood zones to indicate where development is appropriate and where development should not be permitted.
- 3.11. The Environment Agency's Flood Map for Planning indicates that the site falls within Flood Zone 1.
- 3.12. With reference to Table 2, the proposed residential development falls into the 'More Vulnerable' flood risk vulnerability classification, which includes buildings used for dwelling houses.
- 3.13. With reference to Table 3, all uses of land are appropriate in Flood Zone 1.

Probability

3.14. A definition of each Flood Zone and probability of river or sea flooding is provided in Table 1 at paragraph 65 of the Flood Risk and Coastal Change Planning Practice Guidance (Reference ID: 7-065-20140306). Flood Zone 1 Low Probability is defined as land having a less than a 1 in 1000 (0.1%) annual probability of river or sea flooding.

The Sequential Test and Exception Test

3.15. Paragraph 157 of the NPPF states:

'All plans should apply a sequential, risk-based approach to the location of development - taking into account the current and future impacts of climate change – so as to avoid, where possible, flood risk to people and property.'

3.16. Paragraph 158 of the NPPF goes onto state:

'The aim of the sequential test is to steer new development to areas with the lowest probability of flooding. Development should not be allocated or permitted if there are reasonably available sites appropriate for the proposed development in areas with a lower risk of flooding. The strategic flood risk assessment will provide the basis for applying the test. The sequential approach should be used in areas known to be at risk now or in the future from any form of flooding.'

3.17. Paragraph 159 of the NPPF states:

'If it is not possible for development to be located in zones with a lower risk of flooding (taking into account wider sustainable development objectives), the exception test may have to be applied. The need for the exception test will depend on the potential vulnerability of the site and of the development proposed, in line with the Flood Risk Vulnerability Classification set out in national planning guidance.'

3.18. Paragraph 160 of the NPPF states:

'The application of the exception test should be informed by a strategic or site-specific flood risk assessment, depending on whether it is being applied during plan production or at the application stage. For the exception test to be passed it should be demonstrated that:

- a) the development would provide wider sustainability benefits to the community that outweigh the flood risk; and
- b) the development will be safe for its lifetime taking account of the vulnerability of its users, without increasing flood risk elsewhere, and, where possible, will reduce flood risk overall.'
- 3.19. Paragraph 161 of the NPPF goes onto state:

'Both elements of the exception test should be satisfied for development to be allocated or permitted.'

3.20. Paragraph 162 of the NPPF states:

'Where planning applications come forward on sites allocated in the development plan through the sequential test, applicants need not apply the sequential test again. However,

the exception test may need to be reapplied if relevant aspects of the proposal had not been considered when the test was applied at the plan-making stage, or if more recent information about existing or potential flood risk should be taken into account.'

3.21. Paragraph 163 of the NPPF states:

When determining any planning applications, local planning authorities should ensure flood risk is not increased elsewhere. Where appropriate, applications should be supported by a site-specific flood risk assessment. Development should only be allowed in areas at risk of flooding where, in the light of this assessment (and the sequential and exception tests, as applicable) it can be demonstrated that:

- a) within the site, the most vulnerable development is located in areas of lowest flood risk, unless there are overriding reasons to prefer a different location;
- b) the development is appropriately flood resistant and resilient,
- c) it incorporates sustainable drainage systems, unless there is clear evidence that this would be inappropriate;
- d) any residual risk can be safely managed; and
- e) safe access and escape routes are included where appropriate, as part of an agreed emergency plan.'
- 3.22. The Notes to Table 3 in the Flood Risk and Coastal Change Planning Practice Guidance (Reference ID: 7-067-20140306) indicate that the application of the sequential test should be applied first to guide development to Flood Zone 1, then Zone 2, and then Zone 3.
- 3.23. The site falls within Flood Zone 1 and on this basis the sequential test is passed.

Climate Change

- 3.24. The NPPF requires development to take account of the impacts of climate change. The allowances to be made for climate change effects when assessing flood risk are related to the lifetime of the development.
- 3.25. Guidance on the lifetime of development is provided at paragraph 26 in the Flood Risk and Coastal Change Planning Practice Guidance (Reference ID: 7-026-20140306). Residential development should be considered for a minimum of 100 years, unless there is specific justification for considering a shorter period.
- 3.26. Under heading 4 in the Site-Specific Flood Risk Assessment Checklist in the Flood Risk and Coastal Change Planning Practice Guidance (Reference ID: 7-068-20161116), it asks how is flood risk at the site likely to be affected by climate change and states that further advice on how to take account of climate change in flood risk assessments is available from the Environment Agency. Guidance published by the Environment Agency on 19 February 2016, and last updated on 22 July 2020, entitled 'Flood risk assessments: climate change allowances', sets out the climate change allowances to be used for peak river flow by river basin district, peak rainfall intensity, sea level rise, offshore wind speed and extreme wave height.
- 3.27. Table 1 of 'Flood risk assessments: climate change allowances' gives the peak river flow allowances by river basin district for 3 categories: central, higher central and upper end, and 3

time frames. The appropriate allowance to use depends on the flood zone and the flood risk vulnerability classification of the development.

- 3.28. The site lies in the South East river basin district, and the proposed change of use falls into the 'More Vulnerable' flood risk vulnerability classification. Based on the flood zone and flood risk vulnerability classification of the development, the higher central and upper-end allowances need to be used to assess the range of impact. The total potential change anticipated for 2070 to 2115 is given as 35% for the higher central category and 70% for the upper-end category. The previous normal climate change allowance used for peak river flows was 20%.
- 3.29. The peak rainfall intensity allowances to be used when designing urban drainage systems are given in Table 2 of 'Flood risk assessments: climate change allowances'. Both the central and upper-end allowances need to be assessed to understand the range of impact. The total potential change anticipated for 2060 to 2115 is 20% for the central category, and 40% for the upper-end category.

Standard of Protection

3.30. In terms of providing an acceptable standard of protection against flooding for new development, paragraph 54 in the Flood Risk and Coastal Change Planning Practice Guidance (Reference ID: 7-054-20150415) advises how development can be made safe from flood risk. Reference is made to the ability of residents and users to safely access and exit a building during a design flood. Paragraph 55 in the Flood Risk and Coastal Change Planning Practice Guidance (Reference ID: 7-055-20140306) defines a "design flood" as follows:

'This is a flood event of a given annual probability, which is generally taken as:

- fluvial (river) flooding likely to occur with a 1% annual probability (a 1 in 100 chance each year) or;
- tidal flooding with a 0.5 per cent annual probability (1 in 200 chance each year),

against which the suitability of a proposed development is assessed and mitigation measures, if any, are designed.'

- 3.31. Therefore, in terms of providing an acceptable standard of protection against flooding for new development, no flooding of property should occur as a result of the 'design flood' corresponding to a 1 in 100-year fluvial flood event, or a 1 in 200-year tidal flood event, taking account of climate change.
- 3.32. The Government published its 'Non-statutory technical standards for sustainable drainage systems' in March 2015. They should be used in conjunction with the NPPF and planning practice guidance. Standard S7 states that the drainage system must be designed so that flooding does not occur on any part of the site for a 1 in 30-year rainfall event. Standard S8 goes on to state that the drainage system must be designed so that flooding does not occur during a 1 in 100-year rainfall event in any part of a building (including a basement); or in any utility plant susceptible to water within the development.

Site Specific Flood Risk

3.33. In addition to flooding from rivers, it is also necessary to consider the potential consequences of flooding from all other sources, which include directly from rainfall on the ground surface and

rising groundwater, overwhelmed sewers and drainage systems, and from reservoirs, canals and lakes and other artificial sources.

- 3.34. The Government's GOV.UK website contains 'Long Term Flood Risk Information' which includes interactive maps showing 'Flood risk from rivers or the sea' and 'Flood risk from surface water'. These maps show the chance of flooding in one of four risk categories High: greater than 1 in 30 (3.3%), Medium: between 1 in 100 (1%) and 1 in 30 (3.3%), Low: between 1 in 1000 (0.1%) and 1 in 100 (1%), and Very Low: less than 1 in 1000 (0.1%). The 'Flood risk from surface water' map indicates the extent, depth and velocity of water for High, Medium and Low risk scenarios. The Long Term Flood Risk Information also includes a 'Flood risk from reservoirs' map, which includes flood depth and flood speed.
- 3.35. The GOV.UK website advises that when planning a development the detailed flood risk from rivers or the sea information is not suitable for land-use planning, and the Environment Agency's Flood Map for Planning must be used for this purpose.

Flooding from Watercourses

3.36. The nearest watercourse is an ordinary watercourse, located approximately 200m to the east of the site. The ordinary watercourse flows to the south before forming a confluence with the River Rother approximately 1km to the south of the site.

Flooding from Surface Water

3.37. The GOV.UK's Flood risk from surface water map indicates where surface water may be expected to flood or pond. Surface water flooding happens when rainwater does not drain away through the normal drainage systems or soak into the ground, but lies on or flows over the ground instead. The GOV.UK website advises that flooding from surface water is difficult to predict as rainfall location and volumes are difficult to forecast. The information shows the approximate areas that would flood, and which parts would be shallower or deeper. A copy of the GOV.UK Flood risk from surface water map is reproduced in **Figure 3** below.

Learn more about flood risk

Select the type of flood risk information you're interested in. The map will then update.

You can <u>learn more about the ways we describe flood risk</u>. Alternatively select a legend item or feature from the map for an explanation of that flood risk.

'Detailed view' shows more technical information.

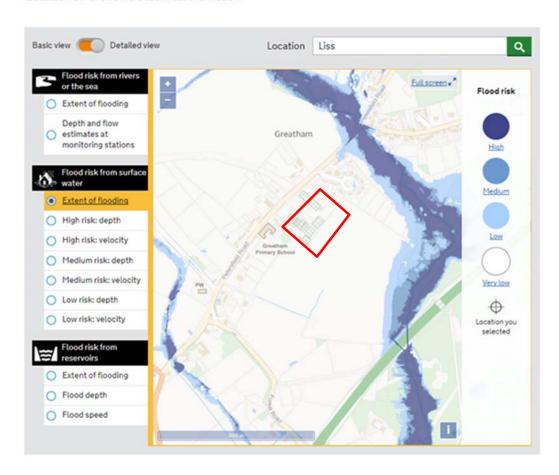

Figure 3: Flood risk from surface water map

- 3.38. The GOV.UK Flood risk from surface water map shows the site lies in an area with a Very Low: less than 1 in 1000 (0.1%) chance of surface water flooding.
- 3.39. The required standard of protection against flooding for the development is that no flooding of property should occur as a result of a 1 in 100-year flood event, which corresponds to the Medium risk scenario on the GOV.UK's 'Long Term Flood Risk Information' maps.

Flooding from Groundwater

3.40. Groundwater flooding is most likely to occur in low-lying areas underlain by water-bearing permeable rocks such as sands, gravels, limestone and chalk. Groundwater flooding occurs as a result of water rising from the underlying rocks or from water flowing from abnormal springs. This tends to occur after long periods of sustained high rainfall. Higher rainfall means more water will infiltrate into the ground and cause the water table to rise above normal levels. In low-lying areas

the water table is usually at shallower depths, so during very wet periods, all the additional groundwater flowing towards these areas can cause the water table to rise to the surface causing groundwater flooding.

3.41. In relation to groundwater flooding, the SFRA states that groundwater flooding on the site is "unlikely".

Flooding from Overwhelmed Sewers and Drainage Systems

- 3.42. Flooding from sewers and drainage systems occurs when the sewer or drainage system is overwhelmed as a result of a blockage or excessive flow exceeding its capacity. Enquiries have been made to South East Water to establish the location of the existing public sewers in the vicinity of the site.
- 3.43. Southern water's Sewer Map shows existing public foul water sewer in Petersfield Road. There are no Surface water Sewers in the vicinity of the Site.
- 3.44. The SFRA does not identify any incident of sewer flooding affecting the site.

Flooding from Artificial Sources

3.45. The GOV.UK's Flood risk from reservoirs map indicates the site is unaffected by flooding from any reservoirs. A copy of the Flood risk from reservoirs map is reproduced in Figure 4 below.

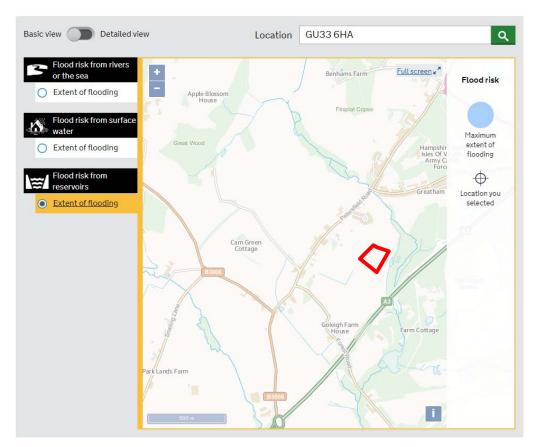

Figure 4: Flood Risk from Reservoirs Map

Summary of Flood Risk

3.46. A summary of the potential risk from all sources of flooding associated with existing conditions pre-development is shown in Table A below.

Table A: Pre-development Potential Flood Risk from All Sources of Flooding

Flood Source	Potential R	isk		Description	
riood Source	Very Low	Very Low Medium High		Description	
Watercourses	Х				The site is located in Flood Zone 1.
Surface Water	х				The topography of the land indicates that any overland flow would be directed from west to east on the site towards a ditch which drains into an existing piped system that outfalls into the nearby brook.
Groundwater	х				The SFRA does not identify any groundwater flooding affecting the site and the underlying geology suggests the risk of groundwater flooding is very low.
Overwhelmed Sewers	Х				There is no existing off-site sewer network near the site. The SFRA does not identify any incident of sewer flooding affecting the site.
Artificial Sources	Х				The site is not affected

- 3.47. The SFRA, and historic flood information provided by the Environment Agency provides an assessment of the impact of all other sources of potential flooding. Based on the SFRA and information provided by the Environment Agency there are no historic flood incidents recorded on the site from all sources of potential flooding.
- 3.48. The pre-development potential flood risk to the site from all sources of flooding is considered to be Very Low.

4. DRAINAGE STRATEGY

Sustainable Drainage Systems

- 4.1. Government policy set out in paragraph 163 of the NPPF states that development should only be allowed in areas at risk of flooding where it can be demonstrated that it incorporates sustainable drainage systems, unless there is clear evidence that this would be inappropriate.
- 4.2. Paragraph 165 of the NPPF states:

'Major developments should incorporate sustainable drainage systems unless there is clear evidence that this would be inappropriate. The systems used should:

- a) take account of advice from the lead local flood authority;
- b) have appropriate proposed minimum operational standards;
- have maintenance arrangements in place to ensure an acceptable standard of operation for the lifetime of the development; and
- d) where possible, provide multifunctional benefits.'
- 4.3. 'Major development' is defined in the NPPF Annex 2: Glossary as:

'For housing, development where 10 or more homes will be provided, or the site has an area of 0.5 hectares or more. For non-residential development it means additional floorspace of 1,000m2 or more, or a site of 1 hectare or more, or as otherwise provided in the Town and Country Planning (Development Management procedure) (England) Order 2015.'

- 4.4. Paragraph 51 in the Flood Risk and Coastal Change Planning Practice Guidance (Reference ID: 7-051-20150323) advises that sustainable drainage systems are designed to control surface water runoff close to where it falls and mimic natural drainage as closely as possible. Sustainable drainage systems provide opportunities to:
 - reduce the causes and impacts of flooding;
 - remove pollutants from urban runoff at source;
 - combine water management with green space with benefits for amenity, recreation and wildlife.
- 4.5. In terms of what sort of sustainable drainage system should be considered, paragraph 80 in the Flood Risk and Coastal Change Planning Practice Guidance (Reference ID: 7-080-20150323) advises that, generally, the aim should be to discharge surface water runoff as high up the following hierarchy of drainage options as reasonably practicable:
 - into the ground (infiltration);
 - to a surface water body;
 - to a surface water sewer, highway drain, or another drainage system;
 - to a combined sewer.

- 4.6. The Government published its 'Non-statutory technical standards for sustainable drainage systems' in March 2015. The technical standards relate to the design, construction, operation and maintenance of sustainable drainage systems and have been published as guidance. The Government expect these standards to apply to all developments of 10 homes or more and to major commercial development.
- 4.7. Paragraph 81 in the Flood Risk and Coastal Change Planning Practice Guidance (Reference ID: 7-081-20150323) states that in considering a development that includes a sustainable drainage system the local planning authority will want to be satisfied that the proposed minimum standards of operation are appropriate. Paragraph 82 (Reference ID: 7-082-20150323) advises that the decision on whether a sustainable drainage system would be inappropriate is a matter of judgement for the local planning authority, taking advice from the relevant flood risk management bodies, including on what sort of sustainable drainage system they would consider to be 'reasonably practicable'. Paragraph 82 states that the judgement of what is reasonably practicable should be by reference to the technical standards and take into account design and construction costs.
- 4.8. Paragraph 83 in the Flood Risk and Coastal Change Planning Practice Guidance (Reference ID: 7-083-20150323) advises that in terms of the overall viability of a proposed development, expecting compliance with the technical standards is unlikely to be reasonably practicable if more expensive than complying with building regulations provided that where there is a risk of flooding the development will be safe and flood risk is not increased elsewhere.
- 4.9. The Government's 'Non-statutory technical standards for sustainable drainage systems' set out peak flow control standards (S2 and S3) and volume control technical standards (S4, S5 and S6). For greenfield developments, the peak runoff rate from the development to any highway drain, sewer or surface water body for the 1 in 1-year rainfall event and the 1 in 100-year rainfall event should never exceed the peak greenfield runoff rate for the same event. For developments which were previously developed, the corresponding runoff rate for these events must be as close as reasonably practicable to the greenfield runoff rate from the development, but should never exceed the rate of discharge from the development prior to redevelopment for that event.
- 4.10. In terms of volume control, where reasonably practicable, for greenfield development, the runoff volume in the 1 in 100 year, 6 hour rainfall event should never exceed the greenfield runoff volume for the same event. Where reasonably practicable, for developments which have been previously developed this runoff volume must be constrained to a value as close as is reasonably practicable to the greenfield runoff volume, but should never exceed the runoff volume prior to redevelopment for that event. Where it is not reasonably practicable to constrain the volume of runoff as described it must be discharged at a rate that does not adversely affect flood risk.
- 4.11. Guidance on the design and construction of SuDS is provided in the 'Interim Code of Practice for Sustainable Drainage Systems', published by the National SUDS Working Group in July 2004, in other CIRIA documents including The SuDS Manual 2015 (CIRIA C753), in the Environment Agency's document entitled 'Sustainable Drainage Systems (SUDS) An introduction', as well as in the Design and Construction Guidance (DCG) published by Water UK.
- 4.12. There are a number of potential SuDS techniques that might be used on any particular site. These include rainwater harvesting systems, pervious pavements, infiltration devices such as soakaways and infiltration trenches, bioretention systems, as well as flow balancing methods including swales, ponds/detention basins, and underground storage facilities.

- 4.13. Approved Document H of the Building Regulations states at Section 3.2 that surface water drainage should discharge to a soakaway or other infiltration system where practicable; discharge to a watercourse may require consent from the Environment Agency; and where other forms of outlet are not practicable, discharge should be made to a sewer.
- 4.14. The use of soakaways, pervious pavements and infiltration devices to discharge surface water runoff to ground depends upon the underlying strata having a suitable permeability. In addition, the Environment Agency will seek to control discharges into underground strata from areas subject to contamination or where groundwater is judged to be at risk from pollution caused by possible contamination.
- 4.15. The SuDS Manual 2015, and CIRIA C687 'Planning for SuDs making it happen', promote the use of a SuDS 'management train', which seeks to address the quality and quantity of runoff at all stages of a drainage system. It uses a hierarchy of techniques, namely: i) prevention, ii) source control, iii) site control and iv) regional control. The drainage strategy for the proposed development seeks to follow the concept of a SuDS management train.
- 4.16. The SFRA states that the site's "SuDS suitability" is "High"

Ground Conditions

- 4.17. The British Geological Survey (BGS) geological mapping of the area shows the majority of the site is underlain by the Folkestone Formation Sandstone.
- 4.18. Based on the Flood Studies Report Winter Rainfall Acceptance Potential (WRAP) Map, as shown reproduced on Drawing Number C795/01 in **Appendix 4**, the site is located in a 'Soil Index Class 4' area. Soil Index Class 4 has the lowest winter rainfall acceptance potential and highest standard percentage runoff, and so suggests the underlying soil has low permeability.
- 4.19. The Cranfield Soil and AgriFood Institute (CSAI), incorporating the National Soil Resources Institute (NSRI,) at Cranfield University maintains soil reports and maps for England and Wales. The Soilscapes dataset map indicates that soils in the area are 'Freely draining slightly acid loamy soils.
- 4.20. A site investigation was undertaken by Leap Environmental Ltd. in October 2017. As part of the site investigation, soakage tests were carried out in four locations across the site in accordance with BRE Digest 365. Tests in three of the four locations failed, with only the test at WS8 registering a result. The site investigation containing the soakage tests is reproduced in **Appendix 5**. The site investigation report includes Borehole Logs from across the site. Clay was encountered in all of the Boreholes recorded.
- 4.21. Based on the foregoing it is considered that the use of soakaways would not provide a suitable means of draining surface water.

Groundwater Source Protection

4.22. From an inspection of the Environment Agency's Aquifer Designation Map dataset held on Natural England's MAGIC website, the site is underlain by a 'principal aquifer'. A copy of the Aquifer Designation Map dataset information is reproduced in Figure 5 below.

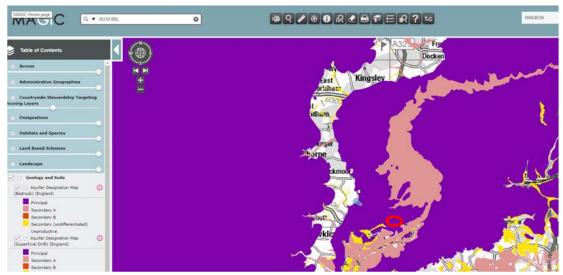

Figure 5: Aquifer Designation Map

4.23. From an inspection of the Environment Agency's Groundwater Source Protection Zone Map the majority of the site falls into Groundwater Zone Source Protection Zone 3, corresponding to the 'total catchment'. A copy of the Environment Agency's Groundwater Source Protection Zone Map is reproduced in **Figure 6** below.

Figure 6: Source Protection Zones

4.24. With reference to the Environment Agency's 'Groundwater protection: policy and practice', the discharge of clean roof water to ground is acceptable both inside and outside SPZ1('inner zone') provided that all roof water down-pipes are sealed against pollutants entering the system from surface run-off, effluent disposal or other forms of discharge.

Surface Water Management

4.25. A sustainable drainage strategy, involving the implementation of SuDS, is proposed for managing the disposal of surface water runoff from the proposed development on the site.

- 4.26. A preliminary surface water drainage strategy is shown on the Indicative Surface Water Drainage Strategy plan, Drawing No. C795/2, a copy of which is contained in **Appendix 6**.
- 4.27. As the use of infiltration devices is not feasible it is proposed that surface water drainage is managed by flow balancing methods, to attenuate and store surface water runoff. The preliminary surface water drainage strategy shown on Drawing No. C795/2 comprises a network of surface water sewers and swales, with further attenuation storage provided in a grassed detention basin and pervious paving; Garastor flow controls are utilised to manage flows into the system from the pervious paving, with a Hydro-Brake flow control to manage the discharge from the system into the off-site watercourse.
- 4.28. The proposed drainage strategy would ensure that surface water arising from the developed site would be managed in a sustainable manner to mimic the surface water flows arising from the site prior to the proposed development, while reducing the flood risk to the site itself and elsewhere, taking climate change into account.
- 4.29. In terms of the SuDS 'management train', the drainage strategy for the proposed development seeks to address the quality and quantity of runoff as follows:-

i) Prevention

4.30. Prevention is the use of good site design and housekeeping measures to prevent pollution. Good site design includes the provision of trapped gullies to retain sediment, and suitably designed rain gardens, swales, pervious paving and a grassed detention basin contribute to the pollutant and sediment removal capability of the management train. The housekeeping measures cover maintenance of the drainage system, including the detention basin, swales, rain gardens, pervious paving and general site maintenance.

ii) Source Control

4.31. Source control is defined in The SuDS Manual 2015 (Ciria C753) as the control of runoff at or near its source, so that it does not enter the drainage system or is delayed and attenuated before it enters the drainage system. Source control measures such as detention areas, are priority features of SuDS networks serving urbanised networks and highways. Planting within these areas encourages evapotranspiration.

iii) Site Control

- 4.32. Site control is the management of water from several sub-catchments within a site. The proposed surface water drainage system amalgamates the runoff from the roofs, roads, and paved areas, for each area of development on the site, and deals with it in a combination of swales, rain gardens, pervious paving, a detention basin and large diameter pipes to attenuate flows and reduce the rate of runoff from the site.
- 4.33. The detention basin, swales, rain gardens and pervious paving would provide attenuation, and would also contribute to the pollutant and sediment removal capability of the SuDS management train, as well as enhance the site's amenity value and provide biodiversity betterment.
- 4.34. The detention basin could incorporate a sediment forebay, designed in accordance with the guidance given in The SuDS manual, to enhance water quality.

iv) Regional Control

4.35. Regional control is the management of runoff from more than one site and so, in this case, is covered by the site control techniques.

Greenfield Runoff

- 4.36. The 'Interim Code of Practice for Sustainable Drainage Systems' states that further information on the calculation of greenfield runoff can be found in DEFRA/Environment Agency R&D Technical Report W5-074/A 'Preliminary rainfall runoff management for developments'.
- 4.37. Table 1 in the 'Rainfall Runoff Management for Developments Interim National Procedure Principles' set out in Report SC030219 sets out that for developments greater than 50 hectares IH Report 124 (Institute of Hydrology Report 124) or the FEH (Flood Estimation Handbook) Q_{MED} equation from the statistical method can be used to calculate the greenfield site peak flow rates. FSSR 2 and 14 regional growth curve factors can be used to calculate the greenfield peak flow rates for other return periods. Where the site is hydrologically similar to the catchment in which it lies, additional FEH techniques can be used to predict flow peaks. Catchment-scale flow predictions will then need to be scaled appropriately to the site area.
- 4.38. Table 1 in the 'Rainfall Runoff Management for Developments Interim National Procedure Principles' set out in Report SC030219 states that for developments between 0-50 hectares one of two approaches can be used:
 - '1. The Institute of Hydrology (IH) Report 124 Flood Estimation for Small Catchments (1994) method can be used to estimate the greenfield site flow rate, QBAR (the Mean Annual Flood).
 - 2. The Index Flood, QMED (the median of the set of annual maximum flood peaks) regression equation that forms part of the FEH statistical method can also be used where the appropriate parameters are known or can be derived/estimated.

Where developments are smaller than 50 ha, the analysis for determining the greenfield index flood flow rate should use 50 ha in the formula and linearly interpolate the flow rate value based on the ratio of the development area.'

4.39. Discharge rate criteria are set out in Point 8 of the 'Rainfall Runoff Management for Developments – Interim National Procedure Principles' in the Environment Agency's Report – SC030219. It states:

The Environment Agency will normally require that, for the range of annual flow rate probabilities, up to and including the 1% annual probability (1 in 100 year) event, the developed rate of runoff into a watercourse should be no greater than the undeveloped rate of runoff for the same event based on the calculation of Q_{BAR} or Q_{MED} and the use of FSSR growth curves. Exceptions only apply where it is not practical to achieve this due to either constraints on the size of the hydraulic control unit (see point 17), or excessive storage volumes. The purpose of this is to retain a natural flow regime in the receiving watercourse and not increase peak rates of flow for events of an annual probability greater than 1%. Three annual probabilities are used to define discharge compliance limits though the critical criteria are for the lowest and highest frequency events; 100% (1 year), 3.33% (30 year) and 1% (100 year).'

4.40. Volumetric criteria are set out in Point 10 of the 'Rainfall Runoff Management for Developments – Interim National Procedure Principles' in the Environment Agency's Report – SC030219, which states:

'Theoretically the stormwater runoff volume from a site should be limited to the greenfield runoff volume for all event frequencies. However this is technically extremely difficult to achieve and therefore compliance to two criteria on runoff volume is required.'

4.41. The two criteria are set out in Points 10.1 and 10.2 as 'Interception' and 'Additional runoff due to development'. Point 10.1 states:

'Interception. Where possible, infiltration or other techniques are to be used to try and achieve zero discharge to receiving waters for rainfall depths up to 5mm.'

4.42. Point 10.2 states:

'Additional runoff due to development. The difference in runoff volume pre- and postdevelopment for the 100 year 6 hour event should be disposed of by way of infiltration, or where this is not feasible due to soil type, discharged from the site at flow rates below 2 l/s/ha.'

4.43. Point 10.3, of the 'Rainfall Runoff Management for Developments – Interim National Procedure Principles' in the Environment Agency's Report – SC030219, states:

'Where compliance to 100 year volumetric criterion is not provided, the limiting discharge for any return period up to the 100 year event shall not be greater than the mean annual peak rate of runoff for the greenfield site (Referred to as Q_{BAR} in IH Report 124) or 2 l/s/ha, whichever is greater.'

IH Report 124 Method

- 4.44. The ICP SuDS module in the MicroDrainage design software (Version 2020.1) enables the calculation of greenfield runoff rates based on the IH Report 124 estimation method with pro-rata values for sites smaller than 50ha.
- 4.45. Greenfield runoff rates have been determined using MicroDrainage design software (Version 2020.1) based on the method set out in IH Report 124. Catchment descriptors have been obtained from the Flood Estimation Handbook (FEH), published by the Institute of Hydrology. Rainfall and soil parameters have been obtained from maps in Volume V of the Flood Studies Report (FSR) within the MicroDrainage design software. FSSR 2 and 14 regional growth curve factors are used to calculate the greenfield peak flow rates for 1, 30 and 100 year return periods.
- 4.46. The FSR WRAP Map, shown in Appendix 4, indicates the site is located in 'Soil Index Class 4', which has the highest standard percentage runoff and suggests the underlying soil has low permeability.
- 4.47. Copies of the MicroDrainage greenfield runoff calculations for the site are included in **Appendix 7**. A summary of the greenfield runoff rates for the various return period events is shown in **Table B**. The mean annual peak rate of runoff, referred to as Q_{BAR} in IH Report 124, is 11.4 l/s.

Table B: Greenfield Runoff Rates

Return Period (Years)	1	Q _{bar}	30	100
Greenfield Runoff Rates (I/s)	9.7	11.4	25.8	36.4

4.48. By limiting the developed rate of runoff to the mean annual peak rate of runoff, Q_{BAR} , for all rainfall events up to the 100 year return period event, including an allowance for climate change, the proposed development would reduce flood risk overall when compared to existing greenfield rates.

Surface Water Flow Balancing

- 4.49. The use of flow balancing methods, comprising a detention basin, swales, pervious paving and large diameter pipes, is proposed in order to attenuate surface water runoff to greenfield runoff rates with discharge to the local watercourse and ditch system.
- 4.50. Preliminary storage calculations have been undertaken to establish the required storage for the development catchment areas on the site using the Network module in XP Solutions' Micro Drainage software system (Version 2017.1.2) for the 1 in 1, 30 and 100 year events plus a 20% and 40% increase in peak rainfall intensity to take account of climate change. The outflow from the drainage system has been constrained to Q_{BAR} , which approximates to a return period of 2.3 years, and hence a reduced rate of runoff for higher return periods. Copies of the Micro Drainage storage estimate screenshot results output for the development catchment areas are reproduced in **Appendix 8**.
- 4.51. For the preliminary storage calculations, it has been assumed that the developed areas would give rise to net rise of 65% of impermeable areas. **Table C** below shows the development catchment areas, the allowable discharge based on the catchment area and a Q_{BAR} value of 11.4 l/s, the required average storage in the detention basin for the 1 in 100 year event, including 20% and 40% allowances for climate change, and the resulting discharge.

Table C: Runoff Rates

Dev Catchment Area	Area (ha)	Imp Area (Ha)	Allowable Discharge (I/s)		Resulting Discharge (I/s)	1 in 100 yr + 40% CC Storage Vol. (m³)	Resulting Discharge (I/s)
Α	1.73	0.72	10.5	386.5	10.4	482.4	10.5

4.52. **Table D** shows the peak runoff rate from the development during the 1 in 1 year and 1 in 100 year rainfall events for the greenfield and post development situations.

Table D: Runoff Rates

	Greenfield	Post-development
1 in 1 year (I/s)	9.7	7.0
1 in 2 year (I/s)	10	7.4
1 in 30 year (I/s)	25.8	10.0
1 in 100 year	36.4	10.5
1 in 100 year plus 20% climate change	43.68	10.5
1 in 100 year plus 40% climate change	50.96	10.5

- 4.53. The detention basin, swales, pervious paving and large diameter pipes shown on the Indicative Surface Water Drainage Strategy plan, Drawing No. C795/2 in Appendix 6, indicate the location and sizes of the required storage facilities to serve the various development areas and are subject to detailed design.
- 4.54. From an inspection of Table D it can be seen that the peak runoff rate from the development for the 1 in 1 year rainfall event and the 1 in 100 year rainfall event never exceed the peak greenfield runoff rate for the same event. The proposed surface water drainage measures therefore ensure the proposed development satisfies the peak flow control standards in the Government's 'Non-statutory technical standards for sustainable drainage systems'.

- 4.55. The above plan and calculations demonstrate that a suitable means of drainage can be provided to drain the developed site in terms of surface water runoff in accordance with the guidance and standards laid down.
- 4.56. The development site was previously developed. The topographical survey shows a number of drainage features, but does not provide full details for the drainage systems serving the existing development on the site. The proposed redevelopment would limit the runoff rate to the Greenfield runoff rate of Q_{BAR} and discharge it via the existing outfall pipe into the nearby brook. The proposed surface water drainage measures would ensure that the development satisfies the peak flow control standards in the Government's 'Non-statutory technical standards for sustainable drainage systems'.

Urban Creep

- 4.57. Paragraph 85 in the Flood Risk and Coastal Change Planning Practice Guidance (Reference ID: 7-085-20150323) advises that any sustainable drainage system should be designed so that the capacity takes account of the likely impacts of climate change and likely changes in impermeable area within the development over its lifetime and continues to provide effective drainage for properties. The likely changes in impermeable area within the development over its lifetime are considered under the term urban creep.
- 4.58. Urban creep is defined in The SuDS Manual 2015 (CIRIA C753) as any increase in the impervious area that is drained to an existing drainage system without planning permission being required, and therefore without consideration of whether capacity of the receiving sewerage system can accommodate the increased flow. It is limited to residential development and for example covers the construction of patios, conservatories, paved driveways etc (post initial construction).
- 4.59. The Local Authority SuDS Officer Organisation (LASOO) document entitled 'Non-Statutory Technical Standards for Sustainable Drainage: Practice Guidance' sets out the appropriate allowances to be applied to the impermeable area within the property curtilage based on residential development densities. For a residential development with a density of 25 or less dwellings per hectare a 10% allowance is applied, reducing to 2% for a density of 50 dwellings per hectare and above, and 0% for flats and apartments.
- 4.60. The proposed residential development on the site equates to a density of 15 dwellings per hectare. Therefore, in order to ensure the capacity of the drainage system takes account of urban creep within the development over its lifetime, a 10% increase has been applied to the impermeable area within property curtilages when designing the drainage system.

Water Quality

- 4.61. Table 4.3 of the Suds Manual advises to utilise the Simple Index Approach described in Section 26.7.1 to assess the measures required to treat the surface water runoff from residential roofs, individual property driveways and low traffic roads.
- 4.62. A Pollution Hazard Assessment has been undertaken for each catchment following the guidance set out in the SuDS Manual, CIRIA C753, London 2015, Section 26.7 'Method of Managing Pollution Risk'. With reference to that document, the appropriate approach is the "simple index approach" for surface water and groundwater. Extracts from Tables 26.2 and 26.3 are set out below.

4.63. For managing pollutant risk, pervious paving is proposed for the private parking in the residential development which allows for infiltration through the structure, treating the runoff before entering into the proposed surface water drainage system, as shown on Drawing number C795/2 - Indicative Surface Water Drainage Strategy, contained in Appendix 6.

Table E: Pollution Hazard Indices for Different Land Use Classification

Land Use	Pollution hazard level	Total suspended solids (TSS)	Metals	Hydrocarbons
Individual property driveways, residential parks, low traffic roads (eg cul de sacs, home zones and general access roads) and non-residential car parking with infrequent change (eg schools, offices) ie < 300 traffic movements/day	Low	0.5	0.4	0.4
Total		0.5	0.4	0.4

4.64. As the implementation of an on-line basin is not feasible, due to elevation issues, pervious paving is proposed to treat the runoff before it enters the surface water sewer system.

Table F: Indicative SuDS Mitigation Indices for Discharge to Surface Waters

Type of SuDS component	TSS	Metals	Hydrocarbons
Permeable pavement	0.7	0.6	0.7

- 4.65. The guidelines recommend that the total SuDS mitigation index must be greater than or equal to the pollution hazard index. Applying the criteria set out in Table 26.2 and 26.3 to each catchment is considered below.
- 4.66. The catchment is mainly in residential land use. The main pollution source would be oils and other materials released from parked vehicles. Pervious paving is proposed for private parking areas to alleviate this pollution factor. Residential roof runoff is designated in table 4.3 to have a pollution hazard level of "Very low". Runoff from the roads would be intercepted by deep trapped gullies and /or swales which intercept suspended sediments and oils, providing a degree of treatment.

Table G: Hazard Indices against Mitigation Indices

Type of SuDS component	TSS	Metals	Hydrocarbons
Hazard Indices (as per table 26.2)	0.5	0.4	0.4
Mitigation Indices (as per Table 26.3) Permeable Paving	0.7	0.6	0.7

4.67. From an inspection of the tables above it can be seen that the mitigation indices are greater than or equal to the hazard indices. It is therefore considered that the provision of pervious paving and deep trapped gullies within the development would appropriately manage the quality of runoff discharging from the site.

Non-statutory technical standards for sustainable drainage systems

4.68. The Government published its 'Non-statutory technical standards for sustainable drainage systems' in March 2015. The technical standards relate to the design, construction, operation and maintenance of sustainable drainage systems and have been published as guidance. The Government expect these standards to apply to all developments of 10 homes or more and to major commercial development.

- 4.69. The 'Non-statutory technical standards for sustainable drainage systems' set out peak flow control standards (S2 and S3) and volume control technical standards (S4, S5 and S6).
- 4.70. Standard S2 states: For greenfield developments, the peak runoff rate from the development to any highway drain, sewer or surface water body for the 1 in 1 year rainfall event and the 1 in 100 year rainfall event should never exceed the peak greenfield runoff rate for the same event.
- 4.71. Standard S3 states: For developments which were previously developed, the peak runoff rate from the development to any highway drain, sewer or surface water body for the 1 in 1 year rainfall event and the 1 in 100 year rainfall event must be as close as reasonably practicable to the greenfield runoff rate from the development for the same rainfall event, but should never exceed the rate of discharge from the development prior to redevelopment for that event.
- 4.72. In terms of volume control, standard S4 states: Where reasonably practicable, for greenfield development, the runoff volume from the development to any highway drain, sewer or surface water body in the 1 in 100 year, 6 hour rainfall event should never exceed the greenfield runoff volume for the same event.
- 4.73. Standard S5 states: Where reasonably practicable, for developments which have been previously developed, the runoff volume from the development to any highway drain, sewer or surface water body in the 1 in 100 year, 6 hour rainfall event must be constrained to a value as close as is reasonably practicable to the greenfield runoff volume for the same event, but should never exceed the runoff volume from the development site prior to redevelopment for that event.
- 4.74. Standard S6 states: Where it is not reasonably practicable to constrain the volume of runoff to any drain, sewer or surface water body in accordance with S4 or S5 above, the runoff volume must be discharged at a rate that does not adversely affect flood risk.
- 4.75. In accordance with Points 8 and 10 of the 'Rainfall Runoff Management for Developments Interim National Procedure Principles' in the Environment Agency's Report SC030219, the limiting discharge rate that does not adversely affect flood risk, for any return period up to the 100 year event, is the mean annual peak rate of runoff for the greenfield site referred to as Q_{BAR}.
- 4.76. In terms of flood risk within the development, the Government's 'Non-statutory technical standards for sustainable drainage systems' include standards S7, S8 and S9.
- 4.77. Standard S7 states: The drainage system must be designed so that, unless an area is designated to hold and/or convey water as part of the design, flooding does not occur on any part of the site for a 1 in 30 year rainfall event.
- 4.78. Standard S8 states: The drainage system must be designed so that, unless an area is designated to hold and/or convey water as part of the design, flooding does not occur during a 1 in 100 year rainfall event in any part of: a building (including a basement); or in any utility plant susceptible to water (eg pumping station or electricity substation) within the development.
- 4.79. Standard S9 states: The design of the site must ensure that, so far as is reasonably practicable, flows resulting from rainfall in excess of 1 in 100 year rainfall event are managed in exceedance routes that minimise the risk to people or property.
- 4.80. **Table H** below demonstrates how the proposed development complies with the relevant standards of the Government's 'Non-statutory technical standards for sustainable drainage systems'. Temporary

Table H: Compliance with Non-statutory technical standards for sustainable drainage systems

Standard	Justification for compliance					
Flood risk ou	Flood risk outside the development					
S1	N/A					
Peak flow co	ntrol					
S2	N/A Previously developed site so S3 applies.					
S3	The peak runoff rate from the development to any drain, sewer or surface water body for the 1 in 1 year rainfall event and the 1 in 100 year rainfall event never exceed the rate of discharge prior to redevelopment for that event.					
Volume cont	trol					
S4	N/A Previously developed site so S5 applies.					
S 5	N/A S6 applies					
\$6	The runoff is discharged at a rate that does not adversely affect flood risk, corresponding to less than $Q_{\text{BAR.}}$					
Flood Risk w	ithin the development					
S7	The surface water drainage system would be designed so that flooding does not occur on any part of the site for a 1 in 30 year rainfall event.					
\$8	The surface water drainage system would be designed so that flooding does not occur during a 1 in 100 year rainfall event within the development.					
\$9	The design of the site ensures that, so far as is reasonably practicable, flows resulting from rainfall in excess of a 1 in 100 year rainfall event are managed in exceedance routes that minimise the risks to people and property.					
Structural in	tegrity					
S10	Components would be designed to ensure structural integrity of the drainage system under anticipated loading conditions over the design life of the development.					
S11	The materials specified by the designer at the detailed design stage would be of a suitable nature and quality for their intended use.					
Designing fo	r maintenance considerations					
S12	N/A. Pumping is not proposed surface water drainage.					
Construction						
\$13	The mode of construction with the existing sewer would comply with the appropriate standards and be inspected by the relevant authority so would not be prejudicial to the structural integrity and functionally of the drainage system.					
S14	Any damage to the drainage system would be rectified before the drainage system is completed to the satisfaction of the relevant authority.					

Flood Risk Management Measures

4.81. A summary of the potential risk from all sources of flooding post-development with the various development mitigation measures incorporated is shown in **Table I** below.

Table I: Post-development Potential Flood Risk from All Sources of Flooding

Flood Source	Potential Risk				Description
	Very Low	Low	Medium	High	Description
Watercourses	Х				The closest proximity watercourse is located 270m to the South East
Surface Water	Х				The risk would be further mitigated by improving the existing surface water management system.
Groundwater	Х				There is no risk reported from Groundwater Flooding.
Overwhelmed Sewers	Х				The proposed drainage system, detention basin, swales and pervious paving would further mitigate any potential off-site sewer flooding affecting the site.
Artificial Sources	X				The site is not affected
Off-site Impacts	Х				By reducing the rate of runoff and intercepting overland flows the proposed development would reduce flood risk overall.

4.82. The incorporation of flood mitigation measures as part of the proposed development would further reduce any risk from river, surface water, and groundwater flooding. By reducing the rate of runoff and intercepting overland flows the proposed development would reduce flood risk overall.

Safe Access and Egress

4.83. The site is located in an area of Flood Zone 1 and is not affected by Surface Water flooding.

Overland Flood Flow Paths

- 4.84. Standard S9 in the Government's 'Non-statutory technical standards for sustainable drainage systems' states that the design of the site must ensure that, so far as is reasonably practicable, flows resulting from rainfall in excess of 1 in 100 year rainfall event is managed in exceedance routes that minimise the risk to people or property.
- 4.85. Overland flood flow paths would follow the natural topography of the land towards the South-East. The design of the internal road network would convey flows towards the South-East in line with the existing situation. Indicative overland flow paths for an extreme event are shown on Drawing No. C795-03 Overland Flowpath in **Appendix 9**.

Off Site Impacts

4.86. By reducing the rate of runoff and intercepting uncontrolled overland flows the proposed development would reduce flood risk overall.

Occupants and Users of the Development

4.87. In accordance with the model checklist in the Flood Risk and Coastal Change Planning Practice Guidance (Reference ID: 7-068-20161116), this section provides a summary of the numbers of future occupants and users of the new development; the likely future pattern of occupancy and use; and proposed measures for protecting more vulnerable people from flooding.

4.88. Compared with the current use, the development proposals would increase the overall number of occupants and/or people using the building or land by approximately 111 people (37 units x average of 3 persons per unit).

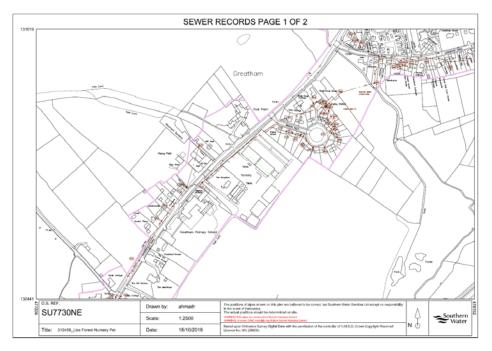

Residual Risk

- 4.89. Paragraph 41 in the Flood Risk and Coastal Change Planning Practice Guidance (Reference ID: 7-041-20140306) advises that residual risks are those remaining after applying the sequential approach to the location of development and taking mitigating actions. Examples of residual risk include:
 - the failure of flood management infrastructure such as a breach of a raised flood defence, blockage of a surface water conveyance system, overtopping of an upstream storage area, or failure of a pumped drainage system;
 - failure of a reservoir, or;
 - a severe flood event that exceeds a flood management design standard, such as a flood that overtops a raised flood defence, or an intense rainfall event which the drainage system cannot cope with.
- 4.90. The site lies within Flood Zone 1 and so the proposed development is fully in accordance with the sequential approach to development set out in the NPPF, the aim of which is to steer new development to areas with the lowest probability of flooding.
- 4.91. The proposed drainage measures would ensure that there is little or no residual risk of property flooding occurring during events well in excess of the minimum acceptable standard of protection for new property, which requires that no flooding of property should occur as a result of a one in 100 year storm event including an appropriate allowance for climate change.
- 4.92. For extreme events it is considered that the proposed development would intercept any uncontrolled overland flow and direct it into the proposed drainage system. The proposed drainage measures would ensure the proposed development would have adequate flood protection for extreme events over the lifetime of the development.

Foul Water Drainage

4.93. Enquiries have been made to Southern Water to establish the location of the existing public sewers in the vicinity of the site, the available capacity at the sewage treatment works, and the adequate point of connection to the public foul water sewer system for the proposed development. A copy of the sewer map is reproduced in **Figure 7 below**.

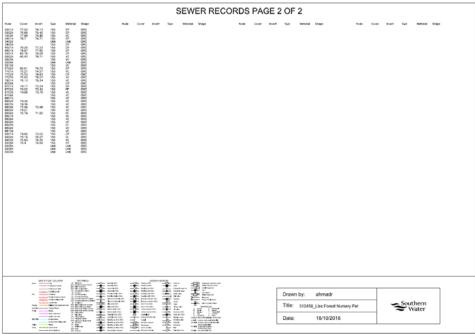

Figure 7: Southern Water Sewer Map

- 4.94. The public sewer map indicates there is existing public foul water sewers located to the west of the site on Peterfield Road. A pumping station would be required to connect the development to the existing sewer network.
- 4.95. In terms of foul water drainage, it has been demonstrated that a suitable means of drainage can be provided to serve the proposed development.

Maintenance Strategy

- 4.96. Paragraph 165 of the NPPF states that for major developments the sustainable drainage systems used should have maintenance arrangements in place to ensure an acceptable standard of operation for the lifetime of the development.
- 4.97. Paragraph 81 in the Flood Risk and Coastal Change Planning Practice Guidance (Reference ID: 7-081-20150323) advises that in considering a development that includes a sustainable drainage system the local planning authority will want to be satisfied that there are clear arrangements in place for ongoing maintenance. Paragraph 85 goes onto advise that when planning a sustainable drainage system, developers need to ensure their design takes account of maintenance requirements of both surface and subsurface components so that it continues to provide effective drainage for properties.
- 4.98. In terms of the maintenance strategy for the proposed drainage measures, it is proposed that the main surface and foul water drainage systems would be adopted by Southern Water, in its role as sewerage undertaker, under a Section 104 Agreement of the Water Industry Act 1991. Southern Water would therefore be responsible for the future maintenance of the adopted drainage systems.
- 4.99. It is proposed that the SuDS system, comprising the detention basin and swales would be adopted by Southern Water based on the Design and Construction Guidance (DCG), or be maintained by a Management Company. Pervious pavements located within property curtilages would be the responsibility of the home owners.
- 4.100. Roads and footways, including highway drainage rain gardens and gullies would be maintained by a Management Company.
- 4.101. Guidance on the operation and maintenance requirements of sustainable drainage systems is contained in The SuDS Manual 2015 (CIRIA C753). There are three categories of maintenance: regular, occasional and remedial. The Management Company would be responsible for putting in place a suitable maintenance plan.
- 4.102. Regular maintenance consists of basic tasks including litter and debris removal, grass cutting, and vegetation management, and includes inspections and monitoring to identify potential system failures such as blockages, silt and sediment build-up, eroded or damaged areas, and condition of inlets and outlets.
- 4.103. Occasional Maintenance comprises tasks that are likely to be required periodically, for example, sediment removal and vegetation replacement.
- 4.104. Remedial Maintenance comprises intermittent tasks to rectify faults and would comprise inlet/outlet repairs, erosion repairs, and dealing with a spillage event.

5. **CONCLUSIONS**

- 5.1. This Flood Risk Assessment has been prepared in connection with a proposed Development of 37 residential dwellings (including affordable homes), alterations to the existing access onto Petersfield Road, hard and soft landscaping, drainage and all other associated development works on land at Liss Forest Nursery, Petersfield Road in Greatham, Liss.
- 5.2. The overall site comprises around 2.4 hectares and is located to the South East of Petersfield Road and to the South West of Bakers Field, which lies in the district of East Hampshire. The postcode is GU33 6EU, and the approximate grid reference for the site is X: 477680, Y: 130730.
- 5.3. The Site is allocated for development in the South Downs local Plan: Adopted July 2019 as "Allocation Policy SD71: Land at Petersfield Road, Greatham".
- 5.4. With reference to the Environment Agency's Flood Map for Planning, the site falls entirely within Flood Zone 1, which has the lowest probability of flooding.
- 5.5. In relation to Flood Risk Vulnerability and Flood Zone 'Compatibility', the planning practice guidance to the NPPF advises that all uses of land are appropriate in Flood Zone 1. On this basis, the Sequential Test is passed.
- 5.6. In addition to flooding from rivers, this Flood Risk Assessment has considered the potential consequences of flooding from all other sources, which include directly from rainfall on the ground surface and rising groundwater, overwhelmed sewers and drainage systems, and from reservoirs and other artificial sources.
- 5.7. An assessment has been made of the potential risk from all sources of flooding to and from the development site, with reference to available flood risk information, for existing conditions predevelopment, and post-development with the various development mitigation measures incorporated.
- 5.8. The available flood risk information includes: The Environment Agency's Flood Map for Planning, local flood history data from all sources of flooding; the GOV.UK 'Long Term Flood Risk Information' interactive maps; and flooding information in the SFRA.
- 5.9. The pre-development potential flood risk to the site from all sources of flooding is considered to be Very low.
- 5.10. In terms of providing an acceptable standard of protection against flooding for new development, no flooding of property should occur as a result of the 'design flood' corresponding to a 1 in 100 year fluvial flood event, taking account of climate change.
- 5.11. The British Geological Survey (BGS) geological mapping of the area shows the majority of the site is underlain by Folkestone formation Sandstone and Sedimentary bedrock.
- 5.12. A site investigation was undertaken by Leap Environmental Ltd. in October 2017. As part of the site investigation, soakage tests were carried out in four locations across the site in accordance with BRE Digest 365. Tests in three of the four locations failed, with only the test at WS8 registering a result. The site investigation report includes Borehole Logs from across the site. Clay was encountered in all of the Boreholes recorded.

- **5.13.** Based on the site investigation it is considered that the use of soakaways would not provide a suitable means of draining surface water runoff from development on the the site.
- 5.14. A sustainable drainage strategy, involving the implementation of SuDS, is proposed for managing the disposal of surface water runoff from the proposed development on the site.
- 5.15. As the use of infiltration devices is not appropriate for the site, flow balancing methods are proposed, comprising a detention basin, swales and large diameter pipes, in order to attenuate surface water runoff to greenfield runoff rates with discharges to the local watercourse.
- 5.16. The proposed drainage strategy would ensure that surface water arising from the developed site would be managed in a sustainable manner to mimic the surface water flows arising from the site prior to the proposed development, while reducing the flood risk to the site itself and elsewhere, taking climate change into account.
- 5.17. Greenfield runoff peak flow rates have been derived using the guidance in the Environment Agency's 'Rainfall runoff management for developments' Report SC030219 published in October 2013. In accordance with this guidance the limiting discharge for any return period up to the 100 year event would not be greater than the mean annual peak rate of runoff for the greenfield site, referred to as Q_{BAR} , which approximates to a return period of 2.3 years, and hence a reduced rate of runoff for higher return periods.
- 5.18. By limiting the development rate of runoff to the mean annual peak rate of runoff, Q_{BAR} , for all rainfall events up to the 1 in 100 year return period event, including an allowance for climate change, the proposed development would reduce flood risk overall when compared to existing greenfield rates.
- 5.19. The proposed drainage measures would ensure that there is little or no residual risk of property flooding occurring during events well in excess of the minimum acceptable standard of protection for new property, which requires that no flooding of property should occur as a result of a one in 100 year storm event taking account of climate change.
- 5.20. For extreme events, it is considered that the proposed development would intercept any uncontrolled overland flow and direct it into the proposed drainage system. The proposed drainage measures would, therefore, ensure the proposed development would have adequate flood protection for extreme events over the lifetime of the development.
- **5.21.** The Micro Drainage calculations contained in this Flood Risk Assessment demonstrate that a suitable means of drainage can be provided to drain the developed site in terms of surface water runoff in accordance with the guidance and standards laid down.
- 5.22. The proposed development complies with the relevant standards of the Government's 'Non-statutory technical standards for sustainable drainage systems'.
- 5.23. In terms of foul water drainage, it has been demonstrated that a suitable means of drainage can be provided to serve the proposed development.
- 5.24. The proposed foul and surface water drainage arrangements can be covered by a suitably worded condition requiring the submission of details to be submitted to and approved by the Local Planning Authority.

- **5.25.** A maintenance strategy for the proposed foul and surface water drainage measures to serve the development has been set out in this document.
- 5.26. This Flood Risk Assessment has demonstrated that the proposed development is compliant with the NPPF, DEFRA/Environment Agency guidance, and Local Plan Policies.
- 5.27. The overall conclusions drawn from this Flood Risk Assessment are that the development would be appropriately safe for its lifetime taking account of the vulnerability of its users, the development would not increase flood risk elsewhere, and would reduce flood risk overall.

Flood risk assessment in flood zone 1 and critical drainage areas - Detailed guidance

You need to do a flood risk assessment if your development is in flood zone 1 and:

- more than 1 hectare
- in an area with critical drainage problems as notified by the Environment Agency

You also need to do a flood risk assessment if your development could be subject to other sources of flooding (eg surface water drains). This includes a change of use to an existing development that makes it more vulnerable to flooding.

Check with your lead local flood authority to see if your development would be affected by other sources of flooding.

Contact your local planning authority to check if your development is in an area with critical drainage problems as notified by the Environment Agency.

You also need to do a flood risk assessment if your development could be affected by other sources of flooding (eg surface water drains) or if the development is now classed as 'more vulnerable' following a change of use. Check this with your lead local flood authority - contact your local council to find out who this is.

Your written flood risk assessment can be in any format but must include the relevant plans, surveys and assessments. Check with your local planning authority if they have any specific software requirements, eg for producing detailed hydraulic models.

Research your development site

Contact the following organisations for information about flood risk in your area:

your lead local flood authority

Contact your <u>local planning authority</u> or check the planning section of their website for their <u>strategic</u> <u>flood risk assessment</u> if one has been adopted as part of the <u>local plan</u>. Refer to the strategic flood risk assessment in your own flood risk assessment.

Check with the Environment Agency if you need to get <u>Environment Agency flood defence</u> <u>consent</u> (permission to do work on or near a main river in England).

Plans

You need to provide a location plan showing:

- street names
- any rivers, streams, ponds, wetlands or other bodies of water
- · other geographical features, eg railway lines or local landmarks such as schools or churches

You can buy a location plan from the Ordnance Survey.

You also need to provide a site plan showing:

- the existing site
- your development proposal
- · any structures that could affect water flow, eg bridges, embankments

Surveys

You need to provide a survey showing:

- · existing site levels
- · the levels of your proposed development

Check with your local planning authority if you also need to show your site in relation to its surroundings.

If you do, you'll have to put site levels in relation to the Ordnance Datum (the height above average sea level). You may be able to find Ordnance Datum information from the <u>Ordnance Survey</u>. If not, you'll need to pay for a land survey carried out by a qualified surveyor.

Assessments

Assess what the risk would be to your development if there was a flood. Consider flooding from other sources (eg surface water drains, a canal) as well as from rivers and the sea.

You should also consider <u>climate change</u> in your assessment.

Surface water drainage

You also need to assess surface water runoff on the site and provide:

- an estimate of how much surface water runoff your development will generate
- details of existing methods for managing surface water runoff, eg drainage to a sewer

 your plans for managing surface water and for making sure there's no increase in the volume of surface water and rate of surface water runoff

Surface water runoff describes flooding from sewers, drains, groundwater, and runoff from land, small water courses and ditches that occurs as a result of heavy rainfall.

Make sure your plans for managing surface water are in line with:

- guidance on managing surface water runoff in your local planning authority's <u>strategic flood risk</u> <u>assessment</u>
- · guidance from your lead local flood authority

Developments on or near main rivers

State in your assessment if you need <u>Environment Agency flood defence consent</u> and if you've applied for it if so.

Submit your flood risk assessment

Submit your completed flood risk assessment with your <u>planning application</u> to your <u>local planning</u> <u>authority</u>.

They'll review your flood risk assessment and tell you if it's satisfactory.

Conduit Sections for SNET 2.SWS

NOTE: Diameters less than 66 refer to section numbers of hydraulic conduits. These conduits are marked by the symbols:- [] box culvert, \/ open channel, oo dual pipe, ooo triple pipe, O egg.

Section numbers < 0 are taken from user conduit table

Section Conduit Major Minor Side Corner 4*Hyd XSect Number Type Dimn. Dimn. Slope Splay Radius Area (mm) (mm) (Deg) (mm) (m) (m^2)

$\underline{2}$ year Return Period Summary of Critical Results by Maximum Level (Rank 1) for $\underline{\text{SNET 2.SWS}}$

Simulation Criteria

Areal Reduction Factor 1.000 Additional Flow - % of Total Flow 10.000
Hot Start (mins) 0 MADD Factor * $10m^3$ /ha Storage 2.000
Hot Start Level (mm) 0 Inlet Coefficient 0.800
Manhole Headloss Coeff (Global) 0.500 Flow per Person per Day (1/per/day) 0.000
Foul Sewage per hectare (1/s) 0.000

Number of Input Hydrographs 0 Number of Storage Structures 32 Number of Online Controls 22 Number of Time/Area Diagrams 0 Number of Offline Controls 1 Number of Real Time Controls 0

Synthetic Rainfall Details

Rainfall Model FSR Ratio R 0.313 Region England and Wales Cv (Summer) 0.750 M5-60 (mm) 20.000 Cv (Winter) 0.840

Margin for Flood Risk Warning (mm) 450.0

Analysis Timestep 2.5 Second Increment (Extended)

STORM SEWER DESIGN by the Modified Rational Method

Design Criteria for SNET 2.SWS

Pipe Sizes SW Export Manhole Sizes SW Export

FSR Rainfall	Model	- England and Wales	
Return Period (years)	2	PIMP (%)	100
M5-60 (mm)	20.000	Add Flow / Climate Change (%)	10
Ratio R	0.313	Minimum Backdrop Height (m)	0.500
Maximum Rainfall (mm/hr)	550	Maximum Backdrop Height (m)	1.500
Maximum Time of Concentration (mins)	30	Min Design Depth for Optimisation (m)	1.200
Foul Sewage (1/s/ha)	0.000	Min Vel for Auto Design only (m/s)	1.00
Volumetric Runoff Coeff.	0.750	Min Slope for Optimisation (1:X)	975

Designed with Level Soffits

Conduit Sections for SNET 2.SWS

NOTE: Diameters less than 66 refer to section numbers of hydraulic conduits. These conduits are marked by the symbols:- [] box culvert, \/ open channel, oo dual pipe, ooo triple pipe, O egg.

Section numbers < 0 are taken from user conduit table

Section Conduit Major Minor Side Corner 4*Hyd XSect Number Type Dimn. Dimn. Slope Splay Radius Area (mm) (mm) (Deg) (mm) (m) (m^2)
